Re: NECC MDL - Case No. 1:13-md-2419 (D. Mass.)

Dear Mr. MacNeill:

In follow-up from our previous letter of January, 2016 regarding the above-captioned litigation, please find attached the following materials for the Deposition by Written Question of The Montclair Orthopaedic Group's designated 30(b)(6) witness:

- 1. A Notice of Deposition;
- 2. A copy of Rule 31 of the Federal Rules of Civil Procedure;
- 3. A copy of written deposition questions for direct examination submitted by the Premier Defendants;
- 4. A copy of written deposition questions for cross-examination submitted by the Plaintiff's Steering Committee.

The facility representative may bring these items with him/her to the deposition. We have scheduled this deposition to take place on <u>February 23, 2016</u> at <u>9:00 AM EST</u> at 200 Highland Ave, Glen Ridge NJ 07028. We will arrange to have a court reporter with experience conducting a deposition by written question present. If this date/time is inconvenient, please contact us as soon as possible to reschedule.

We anticipate that the format of the deposition will be as follows: At the date and time above, a court reporter will meet the facility's designated 30(b)(6) witness at the chosen location to conduct the deposition. At all times the facility has the right to have its attorney present for this deposition.

After the witness is sworn in by the court reporter, the court reporter will read aloud the questions submitted by the Premier Defendants for direct examination, to which the witness will answer orally. Then the court reporter will read aloud the questions submitted by the Plaintiff Steering Committee for

February 8, 2016 Page 2

cross-examination, to which the witness will answer orally. The facility representative will be required to answer only the written questions as they appear. Once all questions have been read and responded to, the deposition will conclude.

Please contact attorney Christopher Wolk at Blumberg & Wolk, LLC, with any questions or concerns. My contact information is as follows:

Christopher Wolk Blumberg & Wolk, LLC 158 Delaware St. P.O. Box 68 Woodbury, NJ 08096 (856) 848-7472 cwolk@blumberglawoffices.com

Thank you for your assistance with this matter.

ALL CASES

DEPOSITION BY WRITTEN QUESTIONS OF MONTCLAIR ORTHOPEDIC GROUP

Pursuant to Fed. R. Civ. P. 31, Premier Orthopedic Associates, Premier Orthopedic Associates Surgical Center, LLC, Kimberly Yvette Smith-Martin, M.D., Thomas Dwyer, M.D., Rahul Shah, M.D., Dr. Richard C. DiVerniero, M.D., (hereinafter "The Premier Defendants" or "Premier") hereby submit the following questions to Montclair Orthopedic Group, to be answered by one or more individuals with knowledge of Montclair Orthopedic Group's medication purchasing practices (and, specifically, its purchases from New England Compounding Center ("NECC")), to be designated by Montclair Orthopedic Group in accordance with Fed. R. Civ. P. 30(b)(6).

Background

- 1. Please state your name.
- 2. Please provide your complete address and phone number with area code.
- 3. Do you work at Montclair Orthopedic Group? If so¹:
 - a. What is your current position?
 - b. How long have you held that position?
 - c. Please describe your job duties at Montclair Orthopedic Group.
- 4. Please provide a brief summary of your educational and employment background, leading up to your present position at Montclair Orthopedic Group.
- 5. Please provide a general description of your facility (e.g., type of practice, number of physicians, etc.).
- 6. By virtue of your role at Montclair Orthopedic Group, are you familiar with Montclair Orthopedic Group's medication purchasing practices?
- 7. Please describe the basis for your familiarity with Montclair Orthopedic Group's medication purchasing practices (e.g., is it from personal knowledge? have you spoken with persons at Montclair Orthopedic Group or reviewed documents?).

Purchases from NECC and actions prior to purchase

- 8. For the years 2010 through 2012, did Montclair Orthopedic Group purchase medications offered for sale by Medical Sales Management and/or New England Compounding Center and made by the New England Compounding Center (hereinafter "NECC")?
- 9. Please describe the timeframes that Montclair Orthopedic Group purchased medications from NECC and what medications were purchased.
- 10. Prior to purchasing medications from NECC, did a representative of Montclair Orthopedic Group perform an in-person inspection of NECC's compounding facility? If so, please (1) state when, (2) describe what was done and what was found, and (3) state whether, following the inspection, Montclair Orthopedic Group purchased medications from NECC.

¹ If not, please state your employer, position, and job duties.

- 11. Prior to purchasing medications from NECC, did Montclair Orthopedic Group conduct research into whether NECC had recalled any medications made by NECC? If so, please (1) describe the research conducted, (2) describe the results, and (3) state whether, following the drug recall research, Montclair Orthopedic Group purchased medications from NECC.
- Prior to purchasing medications from NECC, did Montclair Orthopedic Group conduct research into whether NECC had ever been named as a defendant in a products liability lawsuit? If so, please (1) describe the research conducted, (2) describe the results, and (3) state whether, following the previous lawsuit research, Montclair Orthopedic Group purchased medications from NECC.
- 13. Prior to purchasing medications from NECC, did Montelair Orthopedic Group request information from the Massachusetts Board of Registration in Pharmacy (the "Board") about previous disciplinary actions taken by the Board against NECC? If so, please (1) describe what information was provided by the Massachusetts Board of Registration in Pharmacy and (2) state whether, following the request, Montelair Orthopedic Group purchased medications from NECC.
- 14. Prior to purchasing medications from NECC, did Montclair Orthopedic Group submit a Freedom of Information Act request to the FDA for documentation of disciplinary actions and/or warnings issued to NECC by the FDA? If so, please (1) describe what information was provided by the FDA and (2) state whether, following the request, Montclair Orthopedic Group purchased medications from NECC.
- 15. Prior to purchasing medications from NECC, did Montclair Orthopedic Group search the FDA website for information about NECC? If so, please (1) describe what information was obtained from the FDA website and (2) state whether, following the request, Montclair Orthopedic Group purchased medications from NECC.
- 16. Prior to purchasing medications from NECC, did Montclair Orthopedic Group review transcripts from or summaries of any U.S. Congressional hearings on compounding pharmacies? If so, following the review, did Montclair Orthopedic Group purchase medications from NECC?
- 17. At the time of Montclair Orthopedic Group's purchases from NECC, did Montclair Orthopedic Group have a policy and/or procedure in place prohibiting purchases from compounding pharmacies?
- 18. Please describe any representations Medical Sales Management and/or NECC made to Montclair Orthopedic Group prior to Montclair Orthopedic Group purchasing medications from NECC.

3

- 19. In deciding to purchase medications from NECC, did Montclair Orthopedic Group take into consideration any representations from Medical Sales Management and/or NECC regarding its ability to provide a consistent supply of safe medications?
- 20. Prior to purchasing from NECC, did Montclair Orthopedic Group research compounding pharmacies in CDC literature, *USA Today*, FDA literature, or on YouTube? If so, please (1) describe the research and (2) state whether, following the research, Montclair Orthopedic Group purchased medications from NECC.
- 21. To the best of your knowledge, did any of Montclair Orthopedic Group's patients experience an injury as a result of Montclair Orthopedic Group's purchase, and use, of medications from NECC which were administered to Montclair Orthopedic Group's patients?

Respectfully submitted,

CROSS- EXAMINATION QUESTIONS

THE FOLLOWING 114 QUESTIONS

AND ACCOMPANYING MATERIALS

ARE SUBMITTED BY THE PLAINTIFF

STEERING COMMITTEE. THESE

QUESTIONS ARE TO BE READ AND

ANSWERED SECOND (ONCE ALL

DIRECT EXAMINATION QUESTIONS HAVE

BEEN ASKED AND ANSWERED).

RULE 31 CROSS-EXAM QUESTIONS FOR RULE 31 DEPOSITION OF MONTCLAIR ORTHOPEDIC GROUP

- 1. When did you receive the written deposition questions that were served upon you?
- 2. As this is a deposition upon written questions, you have been provided in advance with every question that will be asked of you today, correct?
- 3. Is it correct that you have an opportunity to consult with an attorney in drafting the answers to those written questions?
- 4. And an attorney assisted you in preparing answers to the written questions, correct?
- 5. What is the attorney's name?
- 6. And you understand that one of the limitations of a deposition upon written questions is that we do not know what your answers will be when we drafted the questions that we submitted?
- 7. Did you or your attorney have any conversations or other communications with any of the attorneys representing Box Hill, Premier Orthopedic and Sports Medicine Associates of Southern New Jersey, LLC (trading as Premier Orthopedic Associates) and/or Premier Orthopedic Associates Surgical Center, LLC? Or Saint Thomas Outpatient Neurosurgical Center?
 - a) (If yes) Please state the date and substance of each such conversation or communication and the identity of the person(s) involved in those conversations.
- 8. Did you or your attorney have any conversations or other communications with any insurers of Box Hill, Premier, or Saint Thomas Outpatient Neurosurgical Center?
 - a) (If yes) Please state the date and substance of each such conversation or communication and the identity of the person(s) involved in those conversations.
- 9. Did you or your attorney have any conversations or other communications with any person employed or associated with Box Hill, Premier, or Saint Thomas Outpatient Neurosurgical Center?

a) (If yes) Please state the date and substance of each such conversation or
communication and the identity of the person(s) involved in those conversations

- 10. Do you have with you any written answers or written notes to answer the written questions which were served upon you?
 - a) (If yes) Are you able to produce those answers or notes to me so that I may mark it as an exhibit?

(Mark as Exhibit___)

- Please describe each document reviewed in preparing your answers or notes to the written questions served upon you?
- 12. Did anyone assist you in preparing these written answers or notes?
 - a) (If yes)
 - i) Who assisted you?
 - ii) What is his or her position?
- 13. Is it correct that Montclair Orthopedic Group (MOG) purchased preservative-free methylprednisolone acetate (which I will refer to as "MPA") from NECC?
- 14. MOG bought products from NECC with Invoice Number 213692, is that right?
- 15. MOG bought products from NECC with Invoice Number 216471, is that right?
- 16. MOG bought products from NECC with Invoice Number 227243, is that right?
- 17. MOG bought products from NECC with Invoice Number 229310, is that right?
- 18. MOG purchased 30 vials of MPA, with lot number 01232012@76, is that correct?
- 19. MOG purchased 45 vials of MPA, with lot number 03072012@101 is that correct?
- 20. MOG purchased 20 vials of MPA, with lot number 04242012@916, is that correct?
- 21. MOG purchased 20 vials of MPA, with lot number 06272012@7, is that correct?

22.	MOG purchased 25	vials of MPA,	with lot number	08022012@103	is that correct?
-----	------------------	---------------	-----------------	--------------	------------------

- 23. Montclair Orthopedic Group is aware that NECC manufactured contaminated lots of MPA in the summer of 2012 that resulted in hundreds of patients contracting infections and over 60 people died as a result of those infections, correct?
 - a) For the rest of this deposition, if these questions use the term "fungal meningitis catastrophe" you will understand that I mean the outbreak of fungal infections in 2012 that stemmed from patients being exposed to contaminated MPA ordered by healthcare providers from NECC, correct?
- 24. Did Montelair Orthopedic Group dispense any of the NECC drugs to any patients?
- 25. When were the drugs dispensed, by date?
- 26. Did you work at Montelair Orthopedic Group prior to the time when Montelair Orthopedic Group began ordering products from NECC?
 - a) (If yes) Were you personally involved in the decision to purchase products from NECC?
 - b) (If no) Who at MOG was involved in the decision to purchase products from NECC?
- 27. Please provide the current work and home address of each person who was involved in the decision to purchase any product from NECC.
- 28. Let me show you an article entitled "GMP and Compounding Pharmacies" by Scott Sutton, which I have marked as Exhibit ____ Please turn to page 55. Looking at the last line of Table 2, prior to September 24, 2012, was Montelair Orthopedic Group aware that, in 1990, "[f]our patients died of an *Enterobacter* infection from a filter-sterilized cardioplegia solution (a parenteral with high potential for bacteremia) compounded in a Nebraska hospital" and that "five bottles of the solution tested were nonsterile, several

- subsequent bottles tested were sterile, and another 93 bottles were dispensed without being tested"?
- 29. Turning to page 56 of the Sutton article, Ex. ____, under the heading "Compounding Pharmacies and Contamination Issues," prior to September 24, 2012, Montclair Orthopedic Group aware that "[b]y the mid-1990s FDA was investigating a number of pharmacies that were operating as manufacturing facilities in response to a number of contamination events"?
- 30. Prior to September 24, 2012, did Montelair Orthopedic Group do any investigation of NECC to determine if it was operating as a manufacturing facility?
 - a) (If yes) Please describe that investigation.
- Prior to September 24, 2012, what, if any, investigation did Montclair Orthopedic Group conduct to determine the volume of drugs that NECC was compounding?
- 32. Please refer to the Sutton article, Ex. ____, page 55, Table 2. Prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 1998, "11 children became septic in California and 10 tested positive for *Enterobacter cloacae* bloodstream infections associated with contaminated prefilled saline syringes from CAPS, Braun-McGaw of Detroit, MI"?
- 33. Referring to Table 2 on page 55 of the Sutton Article, prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 1999, a "[s]urvey of compounded Alprostadil formulations from a variety of sources showed contamination in 18% of samples tested"?
- 34. Looking again at Table 2 on page 55 of the Sutton Article, prior to September 24, 2012, was Montelair Orthopedic Group aware that, in 2001, "13 patients (3 facilities) came down with bacterial meningitis after receiving contaminated compounded bethamethasone injections prepared by Doc's Pharmacy in California"?
- 35. Please turn back to page 55, Table 2, of the Sutton article. Prior to September 24, 2012, was Montclair Orthopedic Group aware that in 2001 "4 children contracted *Enterobacter cloacae* infections from IV ranitidine compounded in a hospital pharmacy"?
- 36. Referring to Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 2001, "Med-Mart Pulmonary Services of California was forced to recall five lots of Albuterol (an inhalant) due to contamination by Serratia liquefaciens"?

- 37. Looking at Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 2002, "MMWR reported on Exophiala (Wangiella) dermatitidis infections from contaminated injectable methyl-Prednisolone prepared by a compounding pharmacy" and that "one patient died"?
- 38. Looking at Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 2003, "[b]acteria contamination with Burkholderia cepacia was found in at least 2 batches of a compounded inhalant solution used by 19,000 patients nationwide with chronic lung diseases"?
- 39. Looking at Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 2004, "36 patients developed *Pseudomonas* bloodstream infections after receiving heparin/saline flushes from multiple lots of preloaded syringes by Pinnacle Medical Supply of Rowlett, TX"?
- 40. Looking at Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 2004, "2 patients reported with life-threatening sepsis caused by *Burkolderia cepacia* from contaminated intravenous flush solutions that had been shipped across state lines"?
- Looking at Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montelair Orthopedic Group aware that, in 2004, "16 patients were reported with Hepatitis C virus infections from a contaminated radiopharmaceutical used in myocardial perfusion studies"?
- 42. Looking at Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 2005, "[u]p to 25 patients in New Jersey and California contracted Serratia marcescens infections due to contaminated magnesium sulfate prepared by Pharmedium, a compounding pharmacy located in Lake Forest, IL"?
- 43. Looking at Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 2005, "6 cases of postsurgical endophthalmitis were reported due [to] a compounded trypan blue ophthalmic injection contaminated with *Pseudomonas aeruginosa* and *Burkholderia cepacia*" and "recalled by the compounding pharmacy Custom-RZ of Richfield, MN"?
- 44. Looking at Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 2005, "10 patients died in Virginia after

exposure to cardioplegia solution from 2 lots contaminated with gram-negative rods" that were "made by Central Admixture Pharmacy Services, Inc. (CAPS), a subsidiary of B. Braun Medical located in Maryland"?

- 45. Montclair Orthopedic Group is located in Glen Ridge New Jersey is that correct?
- 46. Let me show you what has been previously marked as Exhibit 318, a USA Today article published on August 7, 2006 and entitled "Deaths spur debate about drugs made in pharmacies." Can you please read the fourth paragraph on page 1 (beginning with the words "The hospital later determined...")?
- 47. Have you seen that article before today?
- 48. Prior to September 24, 2012, was Montelair Orthopedic Group aware that compounding pharmacies were compounding high risk sterile preparations "under less restrictive rules than those that drug companies follow"?
- 49. Can you please read out loud the second sentence of the sixth paragraph on page 1 (beginning with the words "The frequency and thoroughness...")?
- 50. Prior to September 24, 2012, was Montclair Orthopedic Group aware that the frequency and thoroughness of state inspections of pharmacies vary widely and the FDA's oversight is sometimes hampered by questions over whether it has jurisdiction over what is generally a state matter"?
 - a) (If yes) Did Montelair Orthopedic Group consider the lack of FDA oversight over compounding pharmacies and the lack of state inspections of compounding pharmacies when it decided to outsource the compounding any products from NECC?
- 51. Please read out loud the seventh full paragraph of the 2006 USA Article, Ex. 318, beginning with the words "scrutiny of the pharmacy that served..."
- 52. Turning back to the Sutton Article, Ex. ___, at page 55, Table 2, prior to September 24, 2012, was anyone at Montelair Orthopedic Group aware that, in 2005, "Pseudomonas putida septicemia was reported in a special care nursery due to contaminated flush

- solutions prepared in a hospital pharmacy" and that "36 cases of *Pseudomonas fluorescens* bloodstream infections were associated with a heparin/saline flush'"?
- 53. Looking at Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 2007, "[e]ight cases of Sphingomonas paucimobilis bloodstream infections were associated with contaminated intravenous fentany!"?
- 54. Looking at Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montelair Orthopedic Group aware that, in 2011, "9 patients died of the 19 total taken ill in Alabama when parenteral nutrition solutions that were administered were contaminated with *Serratia marcescens* during compounding using non-sterile components to prepare amino acids"?
- Looking at Table 2 on this same page of the Sutton Article, prior to September 24, 2012, was Montclair Orthopedic Group aware that, in 2011, "16 people in Florida and Tennessee [became] infected when a compounding pharmacy in Hollywood, CA repackaged Avastin for off-label eye injections...[which] resulted in blindness for some"?
 - a) (If yes), Did Montelair Orthopedic Group purchase any of the Avastin at issue in this incident?
- 56. Looking at Table 2 on this same page of the Sutton Article, between June 1, 2010 and September 24, 2012, was Montclair Orthopedic Group aware that in, 2012, "33 people across 7 states contracted fungal endophthalmitis leading to the recall of 6 months' worth of all compounded batches from Franck's Pharmacy"?
- 57. Let me show you what has previously been marked as Exhibit 317 (FDA Consumer Health Info.). Prior to September 24, 2012, was Montelair Orthopedic Group aware that, in 2007, the FDA published a report entitled "The Special Risks of Pharmacy Compounding," which reported that the Agency had reports of more than 200 adverse reports at that time, involving 71 compounded products since 1990?
 - a) (If yes) Did Montclair Orthopedic Group consider that the number of reported adverse events involving compounded drugs could be much lower than the number of actual adverse effects?
- 58. Turning back to p.56 of the Sutton Article, prior to September 24, 2012, was Montelair Orthopedic Group aware that "adverse event reporting is rare for pharmacy

products...because, in contrast to products that are subject to approved drug applications, there are no adverse event reporting requirements for drugs made by pharmacies"?

- 59. Let me show you an article, entitled "Pharmacy Compounding Primer for Physicians," which was written by Sarah Sellers and which I will mark as Ex. ____. Please turn to the paragraph that begins on the bottom of the third page (starting with the words "In a 2004 published analysis..."). Prior to September 24, 2012, was Montelair Orthopedic Group aware of a 2004 published analysis sponsored by STD Pharmaceuticals which found that all samples of 3% sodium tetradecyl sulfate solution purchased from three compounding pharmacies failed content testing and that significant concentrations of the contaminant carbitol were found to be present in the samples from all three compounding pharmacies?
- 60. Turning to the second paragraph on page 4 of the Sellers article (beginning with the words "Mahaguna et al. reported..."), prior to September 24, 2012, was Montclair Orthopedic Group aware of a published analysis of compounded progesterone suppositories from ten randomly selected pharmacies, which found that 9 out of 10 pharmacies provided suppositories that fell outside potency limits for approved products and one pharmacy provided suppositories that tested positive for Comanomal acidovorans bacteremia?
- 61. Let me show you an article by G.J. Whelan, entitled "Subpotency of a Compounded Budesonide for a Nebulization Product in a Patient with Poorly Controlled Asthma," that was published in the Journal of Allergy and Clinical Immunology in 2006, which I will mark as Ex. _____. Prior to September 24, 2012, was Montelair Orthopedic Group aware of a 2006 published report of a probable treatment failure in a poorly controlled asthma patient where an analysis of the inhalation drug only contained an average of 36.8% of the active ingredient in which the authors noted that "use of compounded products are generally discouraged due to concerns of stability and sterility"?
- 62. Going back to the fifth full paragraph on page 3 of the Sellers article, Ex. ____ (starting with the words "In 2006, the FDA conducted..."), prior to September 24, 2012, was Montelair Orthopedic Group aware that, in 2006, the FDA conducted a limited survey of compounded drugs and of 36 samples tested, 12 failed at least one quality test, for a failure rate of 33%?
- 63. Looking at the second full paragraph on page 4 of the Sellers article, Ex. ____ (starting with the words "In a similar analysis..."), between May 1, 2012 and September 24, 2012, was Montclair Orthopedic Group aware of a May 2012 published report where 16 out of 30 samples of hydroxyprogesterone injections purchased from compounding pharmacies exceeded impurity limits for the comparable FDA-approved product?

- 64. Let me show you what I have marked as Exhibit ____. This is a 2010 publication entitled USP 797 Gap Analysis Tool. Prior to September 24, 2012, was Montclair Orthopedic Group aware of what USP 797 was?
- 65. What is your general understanding of USP <797> in plain terms??
- 66. Prior to September 24, 2012, was Montclair Orthopedic Group aware of what a Gap Analysis Tool was?
- 67. Prior to September 24, 2012, was Montclair Orthopedic Group aware that many healthcare providers refused to order from compounding pharmacies due to safety concerns?
- 68. Let me show you what has been marked as Exhibit 305, a 2003 FDA Enforcement Report that was posted on the FDA website. Looking at pages 3 and 4 of this exhibit, prior to September 24, 2012, was Montelair Orthopedic Group aware that NECC had recalled several lots of Betamethasone in February 2003 and that it had recalled preservative-free methylprednisolone during the summer of 2002?
- 69. If you were not aware, would that information have been helpful to you in making a determination to order any product from NECC in 2012?
- 70. Why or why not?
- 71. Let me show you what has been previously marked as Exhibit 306, a 2006 warning letter from the FDA to NECC. Between prior to September 24, 2012, was Montclair Orthopedic Group aware that the FDA had issued a Warning Letter to NECC on December 4, 2006, in which it raised safety concerns regarding NECC's compounding practices?
- 72. Prior to September 24, 2012, was Montelair Orthopedic Group aware that, in 2010, the American Society of Health System Pharmacists ("ASHP") had published a set of guidelines for health systems on outsourcing sterile compounding services?
- 73. Let me show you what has been previously marked as Exhibit 751. These are the 2010 ASHP Guidelines on Outsourcing Sterile Compounding Services. Please turn to the first page (page 372). Under the section entitled "Purpose," can you please read out loud the

- first two sentences (beginning with the words "Health care organizations considering...")?
- 74. Can you turn to page 374 of this same exhibit and read out loud the first two sentences of the second paragraph under the section entitled "Outsourcing Process" (beginning with the words "Some organizations simply...")?
- 75. And on the same page of this exhibit, under the subsection entitled "Contents of Proposals" can you please read out loud the first sentence (beginning with the words "RFPs should require...")?
- 76. In the same subsection, can you please read out loud the sixth bullet point (beginning with the words "Evidence of the following documentation...") and the second sub-bullet point under that (beginning with the words "Current accreditation...")?
- 77. What accreditation or certification certificates did NECC provide to Montclair Orthopedic Group?
- 78. Did Montclair Orthopedic Group ever ask either NECC or the Pharmacy Compounding Accreditation Board ("PCAB") whether NECC was accredited by the PCAB?
- 79. Before September 24, 2012 was Montclair Orthopedic Group aware of the PCAB?
- 80. Please turn back to page 374 of Exhibit 751 and to the same subsection entitled "Contents of Proposals." Can you please read out loud the next sub-bullet point (beginning with the words "Licensure documents...")?
- 81. Prior to September 24, 2012, did Montelair Orthopedic Group ever ask NECC whether it was registered with the FDA as a drug establishment?
 - a) (If yes) What was NECC's response?
 - b) (If no) Prior to September 24, 2012, was Montclair Orthopedic Group aware of the difference between a drug manufacturer and a compounding pharmacy?
- 82. Prior to September 24, 2012, was Montelair Orthopedic Group aware that drug manufacturers were required to be registered with the FDA and had to follow current Good Manufacturing Practices ("cGMPs")?
- 83. Prior to September 24, 2012, was Montclair Orthopedic Group aware of what cGMPs were?

- Please turn back to Exhibit 751 and turn to page 375. Looking at the bullet points at the top left section of the page concerning contents of proposals from compounding pharmacies, please read out loud the seventh bullet point (beginning with the words "Examples of batch reports...").
- Prior to September 24, 2012, did Montclair Orthopedic Group request examples of batch reports for the drugs it obtained from NECC?
 - a) (If yes) 1) Which Logged Formula Worksheets was Montclair Orthopedic Group supplied with by NECC? 2) Did the Logged Formula Worksheets indicate if the product had been sterilized?
 - b) (If no) Did Montclair Orthopedic Group make any inquiry concerning NECC's compounding and sterilization procedures?
- Please return to Exhibit 751. Do you see on page 375, on the left hand side, where the guidelines state that a compounding pharmacy should provide "[a] history of the results of all accreditation or regulatory surveys conducted of the compounding pharmacy's sites, including copies of significant regulatory actions"?
- 87. Prior to September 24, 2012, did Montelair Orthopedic Group ever request NECC to provide copies of regulatory actions taken against it?
- 88. Prior to September 24, 2012, was Montelair Orthopedic Group aware that NECC was registered as a pharmacy with the Massachusetts Board of Registration in Pharmacy ("BoRP")?
- 89. Prior to September 24, 2012 did Montelair Orthopedic Group know that the BoRP had taken a number of regulatory actions against NECC and that these actions were a matter of public record?
- 90. Turning back to page 375 of Exhibit 751, in the section concerning information that the compounding pharmacy should provide in a RFP, can you please read out loud the third bullet point from the bottom on the left side (beginning with the words "Examples of reports...")?
- Prior to September 24, 2012, did Montclair Orthopedic Group request NECC to provide examples of the reports it would provide on the drugs it was compounding for Montclair Orthopedic Group?

- 92. Prior to September 24, 2012, was Montelair Orthopedic Group aware that it could order the sterility test results on each batch lot of the drugs that Montelair Orthopedic Group was ordering and that NECC would send the sterility test results with each order?
- 93. Did Montclair Orthopedic Group ensure that the PROVIDONE IODINE that it ordered from NECC had undergone a sterility test for 14 days before administering it to Montclair Orthopedic Group's patients?
- 94. Did Montclair Orthopedic Group receive sterility test reports with its orders from NECC?
 - a) (If yes) 1) Did Montclair Orthopedic Group review and understand the sterility test results? 2) Did the sterility test results indicate how many sample units of the drugs had been tested for sterility?
- 95. Please turn back to page 375 of Exhibit 751. Looking on the right side of the page, can you please read out loud the first bullet point under the phrase "Additional information to obtain from the prospective compounding pharmacy but not necessarily contained in the proposal may include"?
- 96. Prior to September 24, 2012, did Montclair Orthopedic Group request NECC to provide any information concerning prior product liability lawsuits against it?
 - a) (If yes) 1) What information did NECC provide? 2) When did NECC provide such information?
 - b) (If no) Prior to September 24, 2012, was Montclair Orthopedic Group aware that NECC had been sued in a 2004 product liability lawsuit involving one of its compounded steroids and that NECC had settled that case in 2007?
- 97. Turning back to Exhibit 751, page 375, can you please read out loud the second bullet point on the right hand side under the bullet point concerning product liability lawsuits (beginning with the words "A description of the compounding pharmacy's...")?
- 98. Prior to September 24, 2012, had Montclair Orthopedic Group ever inquired of NECC as to whether NECC had recalled any of its compounded products?
- 99. Turn back to Exhibit 751, p. 375. On the right hand side, can you please read out loud the two sentences under the section "Visits to Compounding Pharmacies and Their Clients" (beginning with the words "Compounding pharmacies should allow...")?

- 100. Prior to September 24, 2012, did NECC allow Montclair Orthopedic Group to visit its compounding facility?
- 101. Let me show you what has previously been marked as Exhibit 526. Do you recognize this as a NECC brochure that was distributed to healthcare providers?
- 102. Prior to September 24, 2012, did Montelair Orthopedic Group receive a copy of this brochure?
- 103. What written materials did Montclair Orthopedic Group receive from NECC prior to September 24, 2012?
- Do you see on the first page, section D.c., that NECC informed healthcare providers that "[s]amples from final product batch lots are sent to an independent FDA registered analytical lab for sterility, endotoxin (pyrogenicity) and potency testing"?
- 105. Prior to September 24, 2012, what was Montclair Orthopedic Group's understanding of the term "final product batch lots"?
- 106. Did Montclair Orthopedic Group ever inquire of NECC as to what "final product batch lots" were?
- 107. Prior to September 24, 2012, was Montclair Orthopedic Group aware that a patient-specific prescription was required in order for a drug to be dispensed by NECC?
- 108. Prior to September 24, 2012, was Montelair Orthopedic Group part of a larger health system?
 - a) (If yes) Please explain Montclair Orthopedic Group's affiliation with the larger health system.
- 109. Prior to September 24, 2012, did Montelair Orthopedic Group or its health system have any policies and/or procedures in place regarding the ordering of high risk compounded drugs for its patients?
 - a) (If yes) Please describe those policies and/or procedures.
- 110. Does Montclair Orthopedic Group have any such policies and/or procedures in place now?

- a) (If yes) Please describe those policies and/or procedures.
- b) Did Montclair Orthopedic Group put these policies and procedures in place following the fungal meningitis catastrophe?
- 111. For each order of a drug Montelair Orthopedic Group purchased from NECC please state whether it was on Montelair Orthopedic Group's drug formulary at the time it was ordered from NECC.
- 112. The next Exhibit is a Prescription Order Form, marked as Exhibit __. Did Montelair complete such a form for each product purchased from NECC?
 - A) If no, why not?
- 113. Prior to September 24, 2012, was there anyone at Montelair Orthopedic Group who had expertise in microbiology?
 - a) (If yes) Please identify those individuals and state whether each was involved in the decision to purchase drugs from NECC.
- 114. For each of the drugs that Montclair Orthopedic Group ordered from NECC please state the following:

Did Montclair Orthopedie Group purchase that drug from any other source between January 1, 2006 and December 31, 2015?

(If yes) Please state a) the price paid for each such purchase; b) the entity(s) each such drug was ordered from; c) whether each such entity was registered with the FDA at the time of each such order; and d) please describe any investigation Montelair Orthopedic Group conducted of each such entity.

GMP and Compounding Pharmacies

amout State on Raid.

It seems self-evident today, but worth remembering, that the pharmaceutical industry exists on a foundation of trust. Patients or even doctors have no way to actually determine the strength, purity and quality of the medicines prescribed and taken. Everyone trusts that the label is accurate and the medicines are pure. This was not always the case and efforts to safeguard our medicine supply led directly to USP, FDA and the GMPs.

Recently we have been reminded of the critical nature microbial Quality control plays in safe medications as contaminated medicine shipped nationally from a compounding pharmacy has sickened hundreds. The New England Compounding Center (NECC) of Framingham, MA was responsible for the manufacture of preservative-free methylprednisolone acetate. This was an aseptically produced parenteral, delivered intrathecally (directly to the spinal column, bypassing most of the body's defense mechanisms).

It is difficult to envision a more hazardous situation and the results have been disastrous. Three lots of this product have exposed over 20,000 individuals to risk of fungal meningitis, and by latest count (April 15, 2013 - http://www.cdc.gov/hai/outbreaks/meningitis-map.html) have resulted in infections in 733 patients and 53 deaths associated with these Intrinsically contaminated medicines.

In response to this situation, FDA has embarked on an aggressive inspection schedule that resulted in multiple 483 findings in the beginning of 2013 (summarized in Table 1). Review of these 483 observations shows several common findings among the compounding pharmacies that received 483 observations during this time:

- Lack of procedures to prevent microbial contamination
- Problems with the Environmental Monitoring program
- · Problems with batch release
- Lack of validation of the sterifization method
- Inadequate control/cleaning/qualification of critical equipment used in manufacture
- Issues with personnel govvning

Vol 16 no 3

🎇 MICROBIOLOGY »

- Expiry dating of manufactured medicines not supported by a stability study
- Issues with laboratory procedures or control of contract lab
- Issues with investigations
- Control of incoming raw materials and components

These (and others listed in Table 1) are basic GMP requirements, and described in 21 CFR 211 as well as many also being discussed in USP < 797> Pharmaceutical Compounding - Sterile Preparations. For the moment, we will leave USP chapter <797> for discussion later in the article and focus for now on GMP. At a time when we are looking at compounding pharmacies that are functioning as pharmaceutical manufacturers, we need to look back at where pharma was and how we got here, and the genesis and development of the GMP as described in 21 CFR 210/211.

A recent review [1] describes the development of FDA oversight of pharma. Originally the Drug Laboratory in the Bureau of Chemistry (US Department of Agriculture), it was created in 1906 through the Pure Food and Drugs Act. As an agency, however, it was toothless to affect the streams of fraudulent claims and questionable ingredients,

(optum and morphine were very popular for their all-around curative properties), until the 1938 Food, Drug, and Cosmetic Act. This increased authority was direct response to the perceived need for a federal level control on medicines sparked by the production of a sulfonamide elixir using diethyl glycol in their oral product. This situation led to the death of 107 people. FDA was soon faced with another situation in 1941 with the release of sulfathiazole tablets containing phenobarbital as a contaminant. This incident led to the death or injury of over 300 people and served as the impetus for a

drastic revision of manufacturing and quality control practices (2, 3). The further expansion of FDA authority and GMP followed in a series of steps, all reactionary in response to a threat to the public health from manufacturers failing the public trust.

This failure was not always (or even usually) traceable to malfeasance. In fact, most of the cases seemed, in hindsight, to be due to ignorance on the part of the manufacturer as to the safety of his products (hence the requirement to document safety) or in

The GMP has grown with FDA authority and in response to particular issues that have arisen. Validation of sterilization, change control, separation and product protection from cross-contamination with

penicillin, tamper-resistant closures, etc. are all addressed in the GMP in response to an issue in the marketplace.

This, then, is the purpose of GMP - a preventive system to create processes and procedures that assure consistently high quality drugs, along with reactive programs to promptly detect and then prevent recurrences of problems. It is against this background that we examine at what is going on in compounding pharmacies.

Compounding Pharmacies and Contamination Issues

The basic assumption in compounding pharmacies is that the pharmacist is creating a specific formulation in response to a doctor's script for a particular patient. This is a needed function in hospitals and street-corner pharmacies. However, it is not what is causing the problems we are reading about in the news. Some "pharmacies" are operating as pharmaceutical manufacturers, filling batches of thousands of units and then offering them for sale to doctors. These pharmacies, operating under widely varying standards frequently cite their lower costs over GMP manufactured medicines as a selling point. The potential issues this situation creates are obvious. It was precisely this type of situation that led to the generation of GMP,

This is not a small concern. According to a recent ISMP Medication Safety Alert [5]:

"The 2008 revision of the US Pharmacopela (USP) Chapter <797> that left many facilities unable to meet the published standards for sterile compounding as well as the escalation in drug shortages have led to a steady increase in sterile compounding pharmacy services. A 2011 survey showed that 66% of hospital pharmacles outsource some portion of their sterile compounding. In some cases, pharmacists have purchased compounded products without full realization of the risks. An analysis of recent harmful cases of contaminated products from compounding pharmacies revealed breaches of USP <797>, unsafe staff behaviors, untrained and unskilled personnel, improper use of equipment, extended beyond use dating outside of manufacturer labeling without sufficient testing, and/or a lack of basic compounding skills involved in almost all cases. Outsourcing is also used as a cost-savings measure."

We had previous warnings about the dangers of conditions in compounding pharmacies. As early as 1976, the widespread contamination of medications from hospital pharmacies was reported in the literature (9% contamination rate of P. aeruginosa alone (6)). By the mid-1990s FDA was investigating a number of pharmacies that were operating as manufacturing facilities in response to a number of contamination events [7]. This situation led directly to the generation of USP chapter <1206> Pharmacy Compounding Practices In 1996. This was a non-mandatory chapter in USP and was provided for informational purposes.

These problems remain. In 2005 CDC investigated a multi-state outbreak of Serratia marcescens that was traced back to intravenous magnesium sulfate from a compounding pharmacy (8). This outbreak provided additional impetus for the revision of USP

sterile compounding guidance to the current version of USP <797> Pharmoceutical Compounding - Sterile Preparations.

Even later, an industry group conducted a survey on pharmacy practices that described widespread belief of contamination in sterile medications prepared by the pharmacies [9]. While the risk may not be as severe for a hospital pharmacy, compounding a specific medication for immediate administration, in a manufacturing environment the longer storage times may result in microbial proliferation and product spoilage [10]. This concern is supported by current events. For example, FDA reported in 2007 that the Agency had reports of 200 adverse events at that time involving 71 compounded products since 1990 [S]. To put these numbers in context, it should be noted that adverse event reporting is rare for pharmacy products. This is because, in contrast to products that are subject to approved thing applications, there are no adverse event reporting requirements for drugs made by pharmacies. The general public has been made aware of some examples as well - a few of which are outlined in Table 2. As you review these events, please also note that many involve shipment across state lines, and sometimes involve extremely large batch sizes.

USP and Compounding Pharmacies

The early history of USP parallels, in several respects, the recent contamination problems at NECC and the current state of regulation of compounding pharmacles. Early efforts (1790s-1810s) to create a pharmacopeia included the pharmacopeias of the College of Physicians (Philadelphia) and the Massachusetts pharmacopeia. However, not all of the newly-formed states adopted either of these pharmacopelas, which led to an effort to create a new pharmacopela that enjoyed the support of all major medical societies and could serve as a "national" pharmacopeia. The first edition of this pharmacopeia was published in 1820. Throughout the 1800's the compendia was periodically revised, with the participation of pharmacists. The 1906 Pure Food and Drug Act specifically cited USP and the National Formulary (NF) as enforceable standards. The 1938 amendment to the FD&C Act established FDA as the empowered enforcement agency, and again cited USP and NF for standards [11].

Having had a quick look at the history of USP, where a multitude of state-level compendia led to uneven standards, allow us jump to the current time. USP <797> is the recognized standard of practice for compounding pharmacies manufacturing sterile products in the USA. While this standard is a huge improvement over the previous "best practice", it is far less stringent than the pharmaceutical GMP as described in 21 CFR 210/211. This is a point that most be remembered - USP <797> is clearly best practice among the top compounding pharmacies [12] but it is far less rigorous than the expectations of cGMP. This USP chapter's guidance is appropriate for small pharmacies servicing specific prescriptions (its intended use), but is not adequate for large-scale production of pharmaceutical batches.

USP first published information on sterile compounding in 1995 in chapter < 1206> "Sterile Products for Home Use" in USP 23 [13]. This was a general informational chapter on compounding pharmacy and not as effective as was originally hoped [14]. In respose, USP changed the

informational chapter <1206> to the mandatory chapter <797> with the expectation that this change in status would allow enforcement of the provisions. It was also at this point that different levels of "sterile" were incorporated into the chapter [12]. These levels of sterility included low, medium and high risk products based on compounding process, product characteristics and storage conditions, [15]

This effort met with limited success. Voluntary compliance with USP and American Society of Hospital Pharmacies

(ASHP) was low – estimated at 5.2% in a 2003 industry survey (12).

There were several "GMP"-like requirements that were new to the compounding pharmacy. Examples include the requirement for robust ISO Class 5 fill conditions, as well as the contamination control, facility, environmental monitoring, personnel gowning and training requirements.

However, these changes were not sufficient to address the continuing problems with compounding pharmacy Quality issues. In one case, for example, a "for cause" type of inspection ran into difficulty as the inspector objected to the lack of any written procedures. In reply, the pharmacist challenged the inspector to show any such requirement. This, and similar, experiences led to the revision of USP <797> In 2009 to incorporate several additional Quality controls [16].

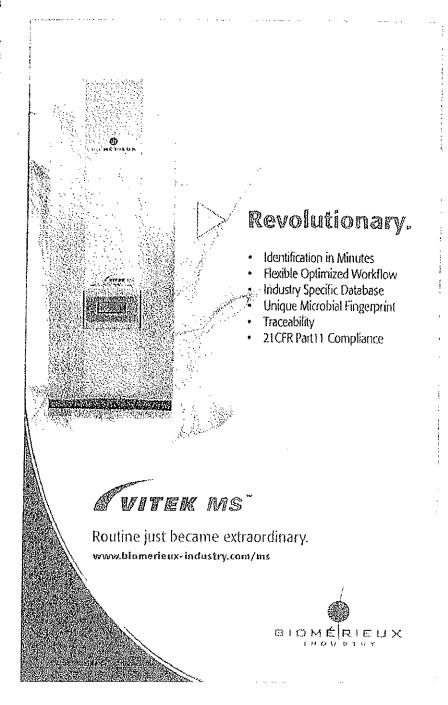

It is interesting to note that at the time of this writing, there remain no uniform expectations for observance of USP <797> requirements and in fact the best estimate is that only 23 states currently require compliance with USP <797> [17]. A recent review article also highlighted the uneven training of pharmacists in the expectations of USP <797> [18]. Finally, we must remember that in comparison to cGMP, USP <797> Quality and safety standards are relatively lax as the expectation is that the medicine will be used immediately on a particular patient under a doctor's specific direction. This is not the target market for the large compounding pharmacies like Massachusetts' now bankrupt NECC,

FDA & Compounding Pharmacies

Although FDA asserts jurisdiction over compounding pharmacies, as a practical

matter, the stated policy of the Agency has been to restrict its attention to large-scale manufacturing in "compounding pharmacies" rather than the traditional creation of a specific formulation in response to a doctor's prescription for a specific patient. As noted in a 2003 GAO report:

"FDA and others have also expressed concern about the potential for harm to the public health when drugs are manufactured and

distributed in commercial amounts without FDA's prior approval. While FDA has stated that traditional drug compounding on a small scale in response to individual prescriptions is beneficial, FDA officials have voiced concern that some establishments with retail pharmacy licenses might be manufacturing new drugs under the guise of drug compounding in order to avoid FDCA requirements." [19]

The concerns expressed by FDA were accurate, although this should be of little surprise given the history of FDA as the national guardian of safe medications. The situation, where a patchwork of state regulations and enforcement capabilities addresses compounding pharmacy practices, lends itself to uneven effectiveness. For example, in a 2003 testimony it was related that North Carolina has six inspectors for 2,000 pharmacies and claimed each was inspected at least every 18 months (this assertion works out to 1 inspector for every 333 pharmacies, with a work load of 19.5 pharmacy inspections with associated paperwork/month—unless the inspector has field complaints to investigate, which take priority over inspections) (19).

This patchwork of regulation remains. The National Association of Boards of Pharmacy (NABP) relates that currently:

"...at least 23 states require compliance with USP <797>... and seven additional boards indicate that they have rules that include some or most of the USP Chapter 797 standards. Three boards of pharmacy have such regulations pending, and another has regulations under consideration. In addition, Hawaii considers compliance with USP Chapter 797 a standard of practice, and the South Carolina Department of Labor, Licensing, and Regulation -Board of Pharmacy Indicates that they have publically instructed licensees that it considers compliance with USP Chapter 797 to be appropriate professional practice and that it will consider serious deviation to be grounds for discipline." [17]

As was described above, USP has been working to develop enforceable guidance for compounding pharmacies in chapters <795> and <797> [12] but as of the time of this writing, state boards of pharmacy have yet to consistently include these expectations in their local standards (17). Even in states that do include them, it is unclear whether the states have the resources to enforce the regulations (20). This concern is supported by data. In a recent series of unannounced inspections by the Massachusetts' Board of Pharmacy in the wake of the NECC scandal [21), only 4 of 40 compounding pharmacles met expected standards [22]. Eleven pharmacies were issued immediate cease and desist orders.

In a revealing letter to FDA, the American Society of Health-System Pharmacists (ASHP) argues against unfettered FDA oversight of large pharmacles arguing that they are a necessary part of American pharmaceutical service and should not be impeded (23). Their position is stated as:

"ASHP has long recognized that hospitals may also enlist the help of qualified compounding pharmacies for some compounded preparations for several reasons. For example, they may not have necessary equipment or facilities to prepare some high-risk preparations, or they may face medication shortages for commercial products that can only be replicated by a compounding pharmacy.

The Society's policy position on compounding (excerpted) is as follows:

- To affirm that extemporaneous compounding of medications, when done to meet immediate or anticipatory patient needs, is part of the practice of pharmacy and is not manufacturing;
- To encourage pharmacists who compound medications to use only drug substances that have been manufactured in Food and Drug Administration-approved facilities and that meet official United States Pharmacopela (USP) compendial requirements where those exist;
- To encourage unaccredited facilities where extemporaneous compounding of medications occurs to seek accreditation by a nationally credible accreditation body;
- To advocate the adoption, in all applicable state laws and regulations governing health care practice, of the intent of the requirements and the outcomes for patient safety as described in United States Pharmacopeia Chapter 797."

In other words, large scale compounding is required because smaller facilities may not have the expertise to make sterile products, and GMP facilities may have shortages. ASHP encourages (but does not support requiring) its members to meet USP <797> standards. The letter continues later:

"A sterile compounding business entity that does not fill prescriptions for individual patients is not a pharmacy. Regulatory oversight of these entities should be dependent on the scope and scale of their operations, which may range from patient-specific small batches to large-scale production of commonly used drugs or formulations based on historical demand. The beyond use date (BUD) or shelf life these entities assign to final products as well as the risk level (low, medium, high) of the compounding activity are also factors.

ASHP believes that the FDA has limited authority to inspect large scale compounding entitles since most are licensed and operating as pharmacies. We believe that FDA's authority needs to be clarified or new authorities given to FDA to regulate compounding businesses that produce large amounts of compounded products, and sell those products to entities other than the end user....

The Society believe IsicI that compounding service providers that operate at the scale and scope of manufacturers should be required to register with the FDA, share details about their operations with the Agency, and submit to routine inspections." [23]

While this last paragraph is encouraging, it seems clear that the safety of the public demands a nationally directed enforcement of GMP on all large-scale pharmaceutical manufacturers, even the ones who have been classified as compounding pharmacies.

Conclusions

GMP may be, at times, difficult to maintain, and sometimes seem overly proscriptive, but it provides a common set of expectations for the establishment and maintenance of controls over product Quality that require care and attention. It is vasily superior to the dangers

of unregulated pharmaceutical products. In an industry dependent on trust, manufacturers and the public both need come commonly accepted practices to guide production as well as someone to police the less educated and prepared manufacturer. This is a national, not a state, issue as the medicines are shipped nationwide where they are needed. We have to be able to have confidence in the strength, quality and safety of our medicines. GMP is the rulebook by which this confidence is encouraged. The dangers of unregulated (or underregulated) production of medicines for national distribution are obvious in the news.

Author Biography

Scott Sutton, Ph.D., is the Principal of Microbiology Network, Inc. (http://www.microbiologynetwork.com), a company he storted in 1996 as a means to encourage training and communications within the microbiological community. He is a recognized consultant and trainer with emphasis in GMP, investigations, Environmental Monitoring and contamination control (both Aseptic manufacturing and non-sterile production facilities) as well as microbiology laboratory audits and operations. The Microbiology Network supplies consulting, training, webinars and e-mail discussion groups. Dr. Sutton is an active author and speaker for the industry, supports PDA and has served with the USP Analytical Microbiology Committee of Experts since 1993. He may be reached at scott.suttan@microbiol.org.

# Deaths spur debate about drugs made in pharmacies

Updated £/7/2008 11:e1 P (4 P 3

Print Reports & Permissions (1995)

Abort Persoud, right, died in Ward: 2004 altor undergoing hourt eargery in Mary Visidalisation. Hospital: He widow, Suo Card Personal, 301, is saling the proposition and buy phenimery has medio-unistensia drugs be your given during surgery.

## STERILE STANDARDS

The following status have adopted storilis compounding standards:

Arkansos None Indologo Oblig Toomes Utah

Source: USP and USA TODAY research

by Julie Applieby, GSA TODAY

in oight days test euromer, the same dangerous inflamment on struck three cardioc surgery passetts at Mary Washington Hospital within hours of their operations. On Sapt. 2, one man

The unusual cluster of cases alarmed criof cardiac surgion John Anniloge, who foamd a contembrant was in the su John furnisge, who found a contamicant was in the surgery conter. Tests confirmed it: Beclaria ware found in a solution injected into patients mounts during surgery.

The Fredericksburg, Va., heapter shut down its cardiac surgery program the next day and called state health officials, who brought in the Food and Dang Administration and the Centers for Disease Control and Prevention. With days, the FDA and the COC conferned the presence of several types of besteris in opened and unopened bags of the conflet surgery solution, a state record later showed.

The hospital later determined that at least 11 carduc surgery parties were stricken during a 10-month period from the end of December 2004 to September 2005, and three died. The literases and deaths drew attention to a practice few patients know about: Some drugs, including high-risk rights propurations, and models in September 100-100. are made in pharmacies under less-restrictive rules than those

LAWSUITS: Fankles blame contamination for 4 deaths

The troubles at king visishington raise questions about the oversight of such pharmacles by heapitate, state regulators and the FDA. Almost all hospital pharmacion do some type of drug and nave variet an nospical prisminación do somo type of drug making, cathat compounding, ranging from low-sex proceduras, such as adding medications to intravenous solutions, to high-sex work, such as making sterile treatments from scretch.

in most states, hospitals are not required to test the sterifity or potency of products made in their own pharmactes or purchased from outside pharmactes. The frequency and thoroughness of state inspections of the pharmacles very widely, and the FDA's role in oversight is cometimes hampened by questions over whether it has judy diction ever what generally is a state matter.

Scrutiny of the pharmacy that served Mary Weekington and 45 other mid-Atlantic modified facilities set off a coscade of actions: Virginia health officials pagged the contaminated solution as the likely calput in the cluster of potant likeases. All injectable medications made by the pharmacy during a six-week period were received, the pharmacy foot he Maryland ligense temporarily, and he partial company recoived an eight-page teleur from the FDA dualiting problems in five of its facilities nationwide.

The hospital was cleared to respect to surpery program two weeks after the testing. The preventer, owned by one of the nation's largest such times, regaland as siste Econse in January. But Architege is still troubled by what he's tenmed about the evereigns of drug-making pharmacies.

"Whose responsibility is it in regulate these compenies that are providing products to essentially every major haspital in the country?" Armisage says. "I just don't see how it can be left to the states alone."

Updating rules

Most hospitals in the USA are involved in making drugs, penurally because some of the products they need arent made by commercial drug companies or patients need specific mixtures. Compounded treatments can include chemotherapy drugs, beguid teeding solutions and intravenous solutions.

Before the rize of large drug companies, most prescriptions were made in pharmacies. Now, the National Association of Boards of Pharmacy estimates that pharmacy-made compounds account for 1% to 5% of all

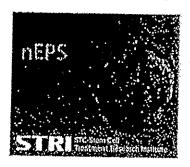

Time pressure, or the cost of having the staff and equipment to mix drugs, leads some trapitals to this outside clas to make compounced products, including difficult-to-prepare atorile crugs.

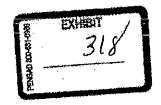

In 2003, Mary Whishington hired Central Admixture Pharmacy Services (CAPS) in Lenhem, Md., to produce a blended cardiac surpary drug called cardiaplegia, the hospital says. The solution stops the front from beating during bypass surgery and must be stadle because it is infused directly into the head.

CAPS, owned by B. Braun Medical, has 20 locations across the country and supplies 400 medical facilities, according to its website, its pharmacles make a variety of treatments, including bloose used to induce labor and treat d'alysis patents.

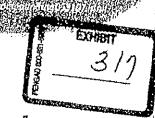

Because of the size, it is one of a few phormatous that his seder regular FDA ownedges, with rotions inspections schooled about every two years. Most pharmaces, even these that make atotile products, are amazer and are oversionally state inspections, not the FDA.

Rules governing such pharmacles vary by state

# The Special Risks of Pharmacy Compounding

harmacy compounding is an age-old practice in which pharmacists combine, mix, or alter ingredients to create unique medications that meet specific needs of individual patients.

It's also a practice that is under FDA scrutiny—mainly because of instances where compounded drugs have endangered public health.

"In its traditional form, pharmacy compounding is a vital service that helps many people, including those who are allergic to inactive ingredients in FDA-approved medications that are not available commercially," says Kathleen Anderson, Pharm.D, Deputy Director of the Division of New Drugs and Labeling Compliance in FDA's Center for Drug Evaluation and Research (CDER).

Compounded medications are also prescribed for children who may be unable to swallow pills, need diluted dosages of a drug made for adults, or are simply unwilling to take bad-tasting medicine.

"But consumers need to be aware

that compounded drugs are not FDAapproved," Anderson says. "This means that FDA has not verified their safety and effectiveness."

Steve Silverman, Assistant Director of CDER's Office of Compliance, says that poor practices on the part of drug compounders can result in contamination or in products that don't possess the strength, quality, and purity required. 'And because patients who use these drugs may have serious underlying health conditions," he says, "these flawed methods pose special risks."

Unlike commercial drug manufacturers, pharmacies aren't required to report adverse events associated with compounded drugs. "FDA learns of these through voluntary reporting, the media, and other sources," says Silverman.

The Agency knows of more than

200 adverse events involving 71 compounded products since 1990. Some of these instances had devastating repercussions.

- Three patients died of infections stemming from contaminated compounded solutions that are used to paralyze the heart during open-heart surgery. FDA Issued a warning letter in March 2006 to the firm that compounded the solutions.
- Two patients at a Washington, D.C., Veterans Affairs hospital were blinded, and several others had their eyesight damaged, by a compounded product used in cataract surgery. The product was contaminated with bacteria. In August 2005, FDA announced a nationwide recall of this Trypan Blue Ophthalmic Solution. Contaminated solution had been

distributed to hospitals and clinics in eight states.

In March 2005, FDA issued a
nationwide alert concerning a
contaminated, compounded
magnesium sulfate solution that
caused five cases of bacterial
infections in a New Jersey
hospital. A South Dakota
patient treated with the product
developed sepsis and died.

# A Iraubling Trans

The emergence over the past decade of firms with pharmacy licenses making and distributing unapproved new drugs in a way that's clearly outside the bounds of traditional pharmacy is of great concern to FDA.

"The methods of these companies seem far more consistent with those of drug manufacturers than with those of retail pharmacles," says Silverman. "Some firms make large amounts of compounded drugs that are copies or near copies of FDA-approved, commercially available drugs. Other firms sell to physicians and patients with whom they have only a remote professional relationship."

FDA highlighted these concerns in August 2006, when it warned three firms to stop manufacturing and distributing thousands of doses of compounded, unapproved inhalation drugs nationwide.

Inhalation drugs are used to treat diseases including asthma, emphysema, bronchitis, and cystic fibrosis. "These are potentially life-threatening conditions for which numerous FDA-approved drugs are available," says Silverman. "Compounded inhalation drugs may be distributed to patients in multiple states, and patients and their doctors may not understand that they are receiving compounded products."

# Parti in consolt

"FDA historically hasn't directed enforcement against pharmacies engaged in traditional compounding," says Anderson. "Rather, we've focused on establishments whose activities raise the kinds of concerns normally associated with a drug manufacturer and whose compounding practices result in significant violations of the new-drug, adulteration, or misbranding provisions of the Federal Pood, Drug, and Cosmetic Áct,"

FDA counts compounded drugs among the new drugs that are covered under the Act. "We consider them new because they're not generally recognized among experts as safe and effective," says Anderson,

She adds that FDA recognizes that states have a central role in regulating pharmacy compounding. "We refer complaints to the states, support them when they request it, and cooperate in investigations and follow-up actions. But there are cases when states are unable to act, and we proceed without them." Anderson says.

### Red Han:

In a May 29, 2002, Compliance Policy Guide devoted to human pharmacy compounding, FDA identifies factors that it considers in deciding upon enforcement action. These factors include instances where pharmacists are:

- compounding drug products that have been pulled from the market because they were found to be unsafe or ineffective.
- compounding drugs that are essentially copies of a commercially available drug product.
- compounding drugs in advance of receiving prescriptions, except in very limited quantities relating to the amounts of drugs previously compounded based on valid prescriptions.
- compounding finished drugs from bulk active ingredients that aren't components of FDAapproved drugs, without an FDAsanctioned, investigational new-

drug application.

- receiving, storing, or using drug substances without first obtaining written assurance from the supplier that each lot of the drug substance has been made in an FDA-registered facility.
- failing to conform to applicable state law regulating the practice of pharmacy.

### What You Can Do

What can consumers do to protect themselves against inappropriate drug-compounding practices? Ilisa Bernstein, Pharm.D, J.D., Director of Pharmacy Affairs in FDA's Office of the Commissioner, offers these tips:

- Ask your doctor if an FDAapproved drug is available and appropriate for your treatment.
- Check with the pharmacist to see if he or she is familiar with compounding the product in your prescription.
- Get information from your doctor or pharmacist about proper use and storage of the compounded product.
- If you receive a compounded product, ask the pharmacist if the doctor asked for it to be compounded.
- If you experience any problems or adverse events, contact your doctor or pharmacist immediately and stop using the product.
- Report any adverse events experienced while using the product to FDA's MedWatch program at http://www.fda.gov/ medwatch/ FDA

# Pharmacy Compounding Primer for Physicians

Prescriber Beware

Sarah Sellers1 and Wulf H. Utian2

- 1 q-Vigilance LLC, North Barrington, IL, USA
- 2 Case Western Reserve University, Cleveland, OH, USA

# **Abstract**

Since the development of federal standards for drug approval, the practice of medicine has historically involved the compounding of medications based on a physician's determination that a US FDA-approved product either did not exist, or could not be used for medical reasons. Today, prescriptions for non-FDA-approved compounded drugs may be driven by funciful and largely unregulated pharmacy advertisements to physicians and patients and/or payer reimbursement policies, thus placing prescribers in the backseat for clinical decision making. This article outlines essential differences between FDA-approved drugs and compounded drugs and reasserts the primary medical role of physicians for determining what medical circumstances may necessitate treatment with non-FDA-approved drugs are discussed. While representing a US perspective, underlying principles apply globally in the setting of magistral and extemporaneous formulations produced outside national regulatory frameworks.

# 1. Introduction

Since the development of federal standards for drug approval, the professions of pharmacy and play an important role in medical care. While the scope of the paper is focused primarily on the US experience, principles apply equally to magistral or extemporaneous formulations that are produced

and efficacy under a New Drug Application (NDA). Approval of an NDA requires substantial evidence of effectiveness, defined under the Federal Food, Drug and Cosmetic Act (FFDCA) as "evidence consisting of adequate and well-controlled investigations by experts qualified by scientific training and experience to evaluate the effectiveness of the drug involved, on the basis of which it could fairly and responsibly be concluded by such experts that the drug will have the effect it purports or is represented to have under the conditions of use prescribed, recommended, or suggested in the proposed labeling."[1] In general, drugs approved under an NDA have demonstrated a positive benefit-risk balance for their intended use on a population level. Generic drugs are reviewed and approved for quality and bioequivalency to an FDA-approved reference drug under an Abbreviated NDA (ANDA). Both brand and generic drugs are required by law to be produced under federal Good Manufacturing Practice (GMP) regulations, a detailed and complex set of working standards established through federal regulation to ensure products meet specific requirements for identity, quality, potency and purity. Pharmaceutical manufacturers are periodically inspected by the FDA for adherence to GMP regulations and to ensure that GMP-driven quality standards established for drugs manufactured for scientific evaluation in clinical trial populations[2] are met or exceeded for drugs manufactured for commercial distribution.[3]

# 3. Compounded Drugs and Traditional Pharmacy Compounding

lack studies to document stability, bioavailability, pharmacokinetics, pharmacodynamics, efficacy and safety. [5,6] This tenet restricts the use of compounded drugs to where they are medically necessary and protects the public from intentional circumvention of the FDA approval and regulatory process that consumers rely on for safe and effective therapies (table I).

State Boards of Pharmacy oversee pharmacy practices, including drug compounding. When the FDA learns of compounding practices that raise public health concerns, the agency may refer the matter to State Boards of Pharmacy for investigation. Using a risk-based approach, the FDA may take enforcement action against pharmacies for circumstances described in FDA Guidance that are not consistent with traditional compounding, including but not limited to the following: [9]

- 1. Compounding drugs prior to receipt of a valid prescription.
- 2. Compounding drugs removed from the market for safety reasons.
- 3. Compounding drugs that are essentially copies of commercially available products.

Table I, Key differences between US FDA-approved and compounded drugs

	FOA-approved drug	Compounded drug
Made 'extemporaneously' after receipt of prescription	No	Yes
Reviewed by FDA for quality, safety and officacy prior to marketing/	Yas	No

Compounded drugs may be made starting with FDA-approved brand or generic drugs, for example, a tablet or capsule may be converted to a liquid form for administration to a child. Benefits of compounding from approved dosage forms include basic confirmation of the identity of the active ingredient and its initial dose. Potential disadvantages include formulation complications from inactive ingredients that may not be suitable for the compounded formulation.

Compounded drugs may also be made with active pharmaceutical ingredients (API) and other inactive components. Benefits of compounding from APIs include the avoidance of binders, and the possibility of accessing drug substances that are not available in suitable commercial forms for the intended use of the compounded product. For example, an oral tablet may contain inactive ingredients that should not be administered by the intravenous route. If such a drug is necessary, it may be preferable to start with an appropriate API, if available. Disadvantages of compounding with APIs include, first and foremost, uncertainty regarding the substance's identity, purity and potency. In addition, due to the complex nature of our global supply chain, an API's origin and disposition throughout the supply chain, including shipping, storage conditions and repackaging, may be difficult for pharmacies and physicians to verify.[10]

By necessity, compounded drugs are made under standards that are less stringent than those applied to FDA-approved products. It would be impossible, for example, to apply for FDA approval for drugs compounded on an individual, extemporaneous basis. Further, traditional pharmacies

manufacturing and approval standards and professional (pharmacy) standards with respect to purpose, scope and enforceability, physicians should be cautious in their judgements regarding what circumstances would justify setting aside a federal standard for a professional one.

### 3.1 Risks Associated with Compounded Medications

Pharmacy-compounded drugs have been associated with quality defects, infectious disease outbreaks and other adverse events which, in some cases, have involved patient deaths. [7,12-17] Because federal surveillance requirements do not exist for compounded drugs, the extent of quality and safety problems is unknown. [16]

### 3.1.1 Substandard Products

While surveillance is limited, quality defects have been reported in conjunction with product recalls, as outcomes of formal, limited investigations by the FDA and Missouri State Board of Pharmacy, and as independent studies, [17,19-24]

In 2004, roughly 1.4 million doses of compounded respiratory solution contaminated with Burkholderia cepacia were distributed to patients nationally. The Missouri State Board of Pharmacy found the pharmacy did not adequately recall potentially affected product and failed to advise patients and prescribers of the contamination risk. The Board issued a temporary restraining order, noting in their petition that the pharmacy "engaged in practices that pose a threat of immediate and irreparable injury, loss or damage to patients and presents a probability of serious danger to the

2016 Sullers & Utlan

after pharmacist Robert Courtney was found to have supplied thousands of cancer patients with substandard chemotherapy that provided only a fraction of prescribed doses,[20] For the years 2005-2009, the Board of Pharmacy testing revealed that failure rates averaged roughly 20% (range 11.6-25.2), with individual findings ranging from 0% to 450% of labelled potency. [23] While the Courtney case involved drug reconstitution and admixing of FDA-approved products, it is critical to this discussion because it illustrates an important limitation of clinical medicine; the dilution scheme went on for years and affected thousands of patients, yet medical observation alone failed to detect lack of effect, including both therapeutic response and expected chemotherapy-related toxicity. In the absence of federal oversight, clinical observation or experience alone may be a poor surrogate for ensuring the quality, safety and effectiveness of compounded drugs.

In a 2004 published analysis sponsored by STD Pharmaceuticals, [27] all samples purchased from three compounding pharmacies failed content testing for a 3% sodium tetradecyl sulfate solution for injection (range 2.59–3.39). Significant concentrations of the contaminant carbitol were found to be present in samples from all three sources (0.33–4.18), suggesting possible use of a non-pharmaceutical grade chemical. In response to the assay results, dermatologist Mitchel Goldman concluded that "Physicians need to be aware that the stated concentration may not be correct and that along with sodium tetradecyl sulfate, potentially harmful contaminants may be present in the solution."

Mahaguna et al. [28] reported an analysis of

Mahaguna et al. [28] reported an analysis of compounded progesterone suppositories from

pharmacies exceeded impurity limits for the approved product. One additional sample of API labelled as hydroxyprogesterone caproate did not contain any active ingredient and was subsequently found to contain only glucose, [17]

# 3.1.2 Morbidify and Mortality Associated with Compounded Drugs

Because pharmacies are not required to conduct surveillance or report adverse events associated with drugs they make, the extent of compounded drug-associated morbidity and mortality cannot be assessed. Sentinel events involving compounded drugs have become known through sporadic reporting by the FDA and the Centers for Disease Control and Prevention (CDC), through case reports published in the literature, and through media reporting. These events are considered the 'tip of the iceberg' by public health experts, because there is little if any transparency as to the extent of exposure to non-FDA-approved, pharmacy compounded drugs and the rate of occurrence of adverse events. [12]

Examples of preventable adverse events include but are not limited to the following:

- An outbreak of Pseudomonas fluorescens blood-stream infections associated with compounded eatheter flush solutions occurred in four states during 2004–5. The CDC noted that sterility testing of finished products, mandated for FDA-approved products, was reportedly not performed in this case and concluded "Companies that manufacture products intended for injection should follow FDA regulations for ensuring the sterility of these products." [14]
- Whelan et al.^[15] reported a probable treatment

At least 12 patients developed eye infections, with some losing all remaining vision. [16]

## 3.2 Controversial Roles of Compounding

While there is a place for traditional pharmacy compounding to fulfil medical needs of individuals that cannot be met with commercially available products, these more controversial aspects threaten to circumvent important public health regulations at the population level. Some controversial uses of pharmacy compounding include the introduction of drug moietics that have been denied or removed from the US market, the mass marketing of specific, non-FDA-approved formulations, and the compounding of drugs for economic reasons.

An interesting example involves the drug 4-aminopyridine. Although physicians had been prescribing unapproved versions of the drug for up to 20 years, it was not until the drug was studied systematically that rare scizures were discovered as a potential side effect. In this case, the medical profession pushed for an approved version to be marketed, rationalizing that if a seizure occurred in the context of a patient taking an FDA-approved alternative, "at least you know it wasn't because of a local compounding pharmacy error." [29]

Another significant example has been the rapid growth of the so-called 'bioidentical postmeno-pausal hormone therapy' market. Following the abrupt termination of the estrogen-progestogen arm of the National Institutes of Health (NIH) Women's Health Initiative Study in July 2002, an alternative market developed promoted by compounding pharmacies and health providers, often with cross-interests. Not subject to the reporting

approved drug, Makena® (17a-hydroxyprogesterone caproate injection). Citing a "unique circumstance," the FDA announced the agency would continue to exercise enforcement discretion and not enforce the FFDCA for compounded versions of the newly approved drug if pharmacies produced the alternatives in accordance with "traditional compounding." [32] The announcement created considerable confusion in the prescribing and reimbursement communities, to the extent that some stakeholders interpreted the FDA enforcement discretion language to mean that compounded versions of 17\u03c4-hydroxyprogesterone caproate had been approved by the FDA for safety and efficacy. On 29 June 2012, the FDA clarified its regulatory language for prescribers, payers and patients, stating that "when an FDA-approved drug is commercially available, the FDA recommends that practitioners prescribe the FDA-approved drug rather than a compounded drug unless the prescribing practitioner has determined that a compounded product is necessary for the particular patient and would provide a significant (medical) difference for the patient as compared to the FDA-approved commercially available drug product." This statement holds at its very core the fundamental public health values of the FFDCA. FDA-approved products produced under federal GMPs represent an essential standard of pharmaceutical care relied on by US citizens, and deviations from this standard of care should be made only under rare circumstances of medical necessity.

## 3.3 Medico-Legal Risks for Physicians

Few prescribing physicians escape concerns

benefits, and the marketing invariably has minimized possibility of risks. Consequently, prescribers of compounded products may be personally exposed should there be an adverse event as a result of administering a product that neither the prescriber nor the compounder can prove to have been pure and free of active contaminants, of correct dose, sterile, etc.[33] Indeed, the FDA has attempted to avoid such risks by its policy against compounding products when an FDA-approved drug exists. Physicians should also be aware that the liability based on inappropriate use of a non-FDA-approved drug can be significant, and possible negative consequences can include the invalidation of their malpractice insurance, personal liability and possible criminal prosecution. This is a situation beyond buyer beware that really is 'prescriber beware'

Prescribing physicians can lesson malpractice exposure. The simple and direct approach would be to only prescribe FDA-approved products, with the sole exception for those patients who require an alternative form that is not available commercially.[34] If prescribers are motivated to prescribe compounded products, and reduced cost is not legally viable as a sole reason, then that prescriber needs to take some active steps to ensure the patient is receiving exactly what was prescribed. These include ascertaining that an FDA-approved equivalent is not available, acquiring information from the compounding pharmacist as to whether their facility is FDA registered, where the raw product was obtained and whether it is pharmaceutical grade for humans, how the batch is stored, whether it has been tested for purity, how and when the product was compounded including sterility, and whether the equipment is free of contaminants of other services with direct marketing of unique formulations to patients and prescribers. Because the idea of using a compounded product in today's marketplace may not arise solely from a physician's identification of a medication problem that requires an alternative to an FDA-approved product, physicians should have a basic understanding of the benefits and risks of compounded drugs to support therapeutic decision making and to help educate patients about their treatment options. In this regard, prescribers are reminded of the following:

- That compounded drugs lack an FDA finding of safety, efficacy and manufacturing quality.
- That compounded drugs are not interchangeable with FDA-approved brand or generic medications.
- That, if an FDA-approved drug is available, the FDA-approved product should be prescribed and used.
- That liability concerns may arise due to prescribers' role as a learned intermediary if patient harm arises in association with compounded drugs.

Subpotentcy of a Compounded Budesonide for Nebulization Product in a Patient with Poorly Controlled Asthma

G.J. Whelsh, J.D. Spehn, E.E. Brown, S.J. Szeller Podicities, National Jewish Medical and Research Conter, Denver, Co.

DOI: http://dx.doi.org/10.1016/j.jac/2005.12.048

Abstract

RATIONALE: Compounding of nebulized medications for patients may be regarded as a matter of convenience and decreased cost for patients. Use of compounded products are cenerally discouraged due to concerns of stability and sterility. We recently evaluated a poorly controlled, severe asitamatic who had been on a compounded budesonide preparation for nebulization.

METHODS: HPLC was performed on five of the patient's budosonide actuales (0.5 mg in 2,5 mL), and were compared to a Pulmicort Respute[®] of the same strength (0.5 mg in 2 mt.). Additionally, we attempted to simulate extreme storage conditions by exposing the Pulmicon Resputer to high temperatures (1278 F), and to sunfight, by placing in an automobile for 72 hours.

RESULTS: The average amount from the five patient samples yielded 38.6% (183.8 µg) of the labeled claim (500 µg), whereas the "control" Pulmicort Respute® produced 91.3% (456.2 µg) of the labeled claim (500 µg). The sunfight exposed sample did not appear to lose potency (93.5%), nor did the heat freated sample (98.7%).

CONCLUSIONS: These findings highlight a major difficulty in using a non-FDA approved generically compounded preparation of a nebulized form of Budesonide, when compared to the manufacture's product. The end result was that the patient received a fraction of the prescribed dose, which may have contributed to his poor control. In addition, it is unclear whether this compounded suspension delivered an adequate particle size distribution in the respirable range

# Introduction

Over the years, there have been countess examples illustrating how contamination of compounded sterile preparations (CSPs) can cause harm to patients. The U.S. pharmacopeia's (USP) General Chapter <797> Pharmaceutical Compounding Sterile Preparations sets forth practice standards meant to help ensure that CSPs are compounded in such a way as to prevent harm to the patients.

The following gap analysis tool is meant to help facilities determine which areas of USP 797 they are in compliance with and which areas they have yet to become compliant with. This tool has taken into account new revisions to USP 797 that became official June 2008 and should be used as a preliminary assessment for compliance with USP 797. One should refer to Chapter 797 for more detail. It should be noted that the following tool has not been provided or endorsed by the USP Convention or the USP Expert Committee on Sterile Compounding. This document is provided for informational purposes only and is not intended as legal advice. It should not be used to replace the advice of your own legal counsel.

To use this tool, follow the 4 steps below. As mentioned above, one should refer to Chapter 797 for more detail if needed. You can also visit our website <a href="https://www.iVinsights.com">www.iVinsights.com</a> or contact us at 800-704-2192 for more information or to speak with a consultant.

 $(\omega_{ij}) = \mathcal{F}^{\text{TT}}_{ij}(\omega_{ij}(\omega_{ij}), \omega_{ij}(\omega_{ij})) + \mathcal{T}^{\text{TT}}_{ij}(\omega_{ij}(\omega_{ij}), \omega_{ij}(\omega_{ij})) + \mathcal{F}^{\text{TT}}_{ij}(\omega_{ij}(\omega_{ij}), \omega_{ij}(\omega_{ij})) + \mathcal{F}^{\text{TT}}_{ij}(\omega_{ij}(\omega_{ij}), \omega_{ij}(\omega_{ij})) + \mathcal{F}^{\text{TT}}_{ij}(\omega_{ij}(\omega_{ij}), \omega_{ij}(\omega_{ij}), \omega_{ij}($ 

Allergen extracts-refers to subcutaneous injections (single dose or multiple dose) preparations of allergen extracts which are prepared by a physician or designated personnel under a physician's supervision.

BUD-'beyond use date'. The date or time after which a CSP shall not be stored or transported.

BSC-'biological safety cabinet'. A cabinet which has an open front and downward airflow. Air that enters and exits the hood is filter by a HEPA filter to protect compounding personnel and the environment. This type of cabinet is considered appropriate for compounding hazardous preparations.

CAI-'compounding aseptic isolator'. Isolator that maintains an aseptic compounding environment and is made specifically for compounding pharmaceuticals, Air from the area surrounding the isolator must first pass through a HEPA filter before passing into the isolator.

CACI-'compounding aseptic containment isolator'. Isolator specifically designed to protect compounding personnel from airborne drug during the compounding process. Air from the area surrounding the isolator must first pass through a HEPA filter before passing into the isolator. When hazardous drugs are prepared in the CACI, the CACI should be vented to the outside using proper building design. This type of cabinet is considered appropriate for compounding hazardous preparations.

CSP-'compounded sterile preparation'. Compounded preparations that must be sterile when administered to a patient. Includes biologics, diagnostics, drugs, nutrients, radiopharmaceuticals, aqueous bronchial and nasal inhalations, baths and soaks for live organs, injections, irrigations for wounds and body cavities, ophthalmic drops and ointments, and tissue implants

CSTD-'closed system vial transfer device'. This is a device that provides a closed system by which fluids may be transferred without venting hazardous substances into the surrounding environment. Ideal for use when preparing hazardous preparations.

**PEC-**'Primary engineering control'. A device or room which provides an ISO class 5 environment. Examples include BSC, CAI and CACIs.

Supervisors-for the purpose of this tool, this term refers to supervisors who supervise compounding and/or dispensing activities and are qualified, licensed healthcare professionals

PPE-'personal protective equipment'. Includes gowns, face masks, eye protection, hair covers and shoe covers.

# The Process

# STEP 1: Define you Risk Level:

Risk Level	Criteria
Low Risk Level Compounding of CSPs	<ul> <li>CSPs which only involve the transfer, measuring or mixing of three or less commercially manufactured packages of sterile products.</li> </ul>
	<ul> <li>Compounding of the CSP does not involve more than two entries into any one sterile container.</li> </ul>
Low Risk Level Compounding with 12 hour or less BUD	<ul> <li>This applies when the PEC is a CAI or CACI that cannot be located within an ISO 7 buffer area</li> </ul>
	<ul> <li>Only low risk, nonhazardous and radiopharmaceutical CSPs which are patient-specific and made according to a physician's order may be prepared under this classification</li> </ul>
	<ul> <li>Administration occurs within 12 hours of preparation or per manufacturer recommendations, whichever is less.</li> </ul>
Medium Risk Level Compounding of CSPs	CSPs are compounded under Low Risk

	Compounding conditions and one or more of the		
	following apply:		
	<ul> <li>More than three sterile products or entries into any container</li> </ul>		
Posta	· ·		
	Sterile products are pooled to make CSPs  to be administrated to any or multiple		
	to be administered to one or multiple		
	patients		
	<ul> <li>Complex aseptic manipulations take place (other than a single volume transfer).</li> </ul>		
	Compounding process is of unusually long		
	duration (i.e. such that requires dissolving		
	ingredients or homogenous mixing).		
	<ul> <li>Compounding of total parenteral nutrition</li> </ul>		
	fluids take place using manual or		
	automated devices		
	Filling of reservoirs of injection/infusion		
	devices which contain three or more		
	sterile drug products and air is evacuated		
	from container prior to dispensing.		
High Risk Level Compounding of CSPs	CSPs are compounded and any of the following		
	apply:		
	Non-sterile ingredients and/or non-sterile		
	devices are used to compound a sterile		
	final product		
	Commercially manufactured sterile		
	products are exposed to air quality worse		
	than ISO 5 for more than 1 hour.		
	The CSP lacks effective antimicrobial		
	preservatives and is exposed to air quality		
	worse than ISO 5 for more than 1 hour.		
	Sterile surfaces of preparation device		
	and/or containers are exposed to air		
	quality worse than ISO 5 or more than 1 hour		
	Non-sterile water-containing preparations		
	are stored for more than 6 hours before		
	sterilization		
Immediate Use CSPs	Immediate use CSPs are exempt from low risk level		
	requirements ONLY when the following apply:		
	There is an emergent need for immediate		
	administration of a CSP		
	<ul> <li>Examples include 'cardiopulmonary</li> </ul>		
	resuscitation, treatment in an emergency		
	room, preparation of diagnostic agents or		
	critical therapy where the preparation of		
	the CSP under conditions described for low		
	risk CSPs subjects the patient to additional		

risk due to defays in therapy.

- Does not include preparations that must be stored for future patient use
- Medium and high risk CSPs are not to be classified as Immediate Use CSPs.
- Immediate use CSPs involve not more than three commercially manufactured sterile, nonhazardous products or radio pharmaceuticals from their original manufacturers' containers with not more than two entries into any one container of sterile solution or administration container/device.
- The compounding procedure is continuous and lasts not more than 1 hour
- If not immediately administered the CSP is under constant supervision to ensure there is no contact with nonsterile surfaces and/or particulate matter and to prevent mix-ups with other CSPs
- Administration of CSP occurs no more than 1 hour after the start of preparation of the CSP
- If the CSP is not completely and immediately administered by the person who prepared it (or at least the administration is completely witnessed by the person who prepared it), the CSP bears a label listing the following: patient identification, names and amounts of ingredients, the names and initials of the person who prepared it and the exact 1 hour BUD and time.

# STEP 2: Perform Gap Analysis

You may use the tool below to perform a gap analysis of your facility comparing it to the USP 797 standards. This tool is meant to be an instrument and by no means is meant to be used as a comprehensive guide to all of the standards presented in USP 797.

# STEP 3: Develop Action Plan

Criteria to which you answered 'no' to will require an action plan. You will have a separate action plan for each criteria you wish to improve upon. If you answered 'yes' to a criteria, but feel you could improve in that area, don't be afraid to utilize an action plan. After all, there is always room for improvement. The action plans you develop should be documented and saved for survey purposes. They

may be used to document to the surveyor that your facility is on its way to compliance with the particular standard. Your surveyor will appreciate your commitment to patient safety and quality.

# STEP 4: Implement, adjust and monitor Action Plan

Few action plans will be put into place and never reevaluated for their effectiveness. Most action plans should include a time frame for how often the plan will be revisited and audited. For the purpose of auditing, it helps to write the action plan in such a way that it includes auditable data that is concise and quantitative so that results can be easily assessed at audit time. It is also recommended that thresholds be determined for your facility for each auditable measure that is assessed as part of an action plan. Audit results that exceed the threshold that your facility will require 'tweaking' of the action plan and further follow-up.

# Documentation is the key!

It is important to document any and all efforts toward compliance with USP 797. As they say, "If it wasn't documented, it didn't happen." Proper documentation will speak volumes when communicating your compliance efforts to a surveyor.

Audio-visual instruction and			
professional publications are utilized			
to train personnel who prepare CSPs			
with regard to theoretical principles,			
practical skills, and achieving and		:	
maintaining an ISO 5 environment.			
Personnel must also pass a written			
competence assessment and undergo			
an observational audit. This training			
takes place before personnel are			
allowed to prepare CSPs.			
Observational audits evaluate garbing			
and gloving techniques including			
proper hand hygiene. The			
observational audit is documented on			
a form and maintained in a permanent			
record.			
Observational audits which evaluate	•		
cleaning and disinfection competency			
are performed for all staff responsible			
for cleaning and disInfection. This	•		
competency assessment is performed			
initially, when cleaning staff changes			
and at the completion of any media fill			
test. A form is used to document the			
observation.			
Personnel are required to pass media			
fill tests prior to preparing CSPs			
initially and at least annually for low			
and medium risk compounding and		<u> </u>	`
semiannually for high risk			

110000000000000000000000000000000000000	· r · · · · · · · · · · · · · · · · · ·	T	1
compounding.	ļ		
Compounding personnel who fail	-		
written, observational or media fill			
tests are promptly reinstructed and re-			
evaluated by qualified compounding			
personnel.			
Gloved fingertip sampling is			
performed initially prior to	]		
compounding CSPs (no less than 3		•	
times) and at least annually (for low			
and medium risk compounding) and			
semiannually (for high risk			
compounding). This assessment is			
performed immediately after the			
evaluation of hand hygiene and			
garbing (above).			·
An evaluation of aseptic manipulation			
takes place for all compounding			
personnel initially and annually (for			
low and medium risk compounding)			
and semiannually (for high risk			
compounding).			
Training includes instruction on how to			
determine if equipment is operating			
properly.			
Quality Assurance (QA)			
Facility has formal QA program in			
place that is formalized in writing.			
Written policies and procedures detail			
the training and evaluation of			
compounding personnel.			
Written policies and procedures			
include in-process checks that are			7
applied, as appropriate, to specific			
CSPs: accuracy and precision of			T-P-P-P-P-P-P-P-P-P-P-P-P-P-P-P-P-P-P-P

semiannually and when facilities	
and/or equipment are re-certified	
An investigation is conducted for cfu	
counts or employee	
audits/competency evaluations that	
are out of the normal range and the	
source of the problem is eliminated.	
Surface sampling is performed in all	
ISO areas on a regular basis.	
A pressure gauge or velocity meter is	
installed between the buffer area and	
anterpom and between the anterpom	
and the area outside the compounding	
area. Results are documented on a log	
at least daily or by a continuous	
reading device. Pressure readings	
between areas follow requirements	
set forth in USP 797.	
Automatic compounding devices	
(ACDs) are tested at least daily for	
accuracy. Results are documented and	
reviewed at least weekly to ensure	
precision of the ACD.	
All CSPs are visually inspected for	
particulate matter and reviewed for	
accuracy (prescription orders,	
compound records, expended	
materials). The process for inspection	
of final CSPs is outlined in policies and	
procedures. This includes a process for	
double-checking each CSP immediately	
prior to release.	
Facility has written procedures for	
verifying the identity and quality of	
CSP prior to dispensing. The procedure	
includes the following:	
1. labels is correct and reflects	
the correct names, amounts,	
volume, BUD, route, storage	
and other information for safe	
use.	
2. Correct identity, purity and	
amounts of ingredients are	, <b></b>

Drug storage areas are monitored to	
ensure proper storage conditions of	
ingredients. Controlled temperature	
areas (i.e. refrigerated, room	
temperature and frozen) are	
monitored at least daily and results	
are documented on a temperature log.	
Standard operating procedures exist	
to ensure storage conditions in	
patient-care settings are appropriate.	
Caregiver training is in place to ensure	
understanding and compliance with	
CSP use. Training includes:	
<ol> <li>Description of the therapy,</li> </ol>	
goals of therapy and expected	
outcomes	
2. How to inspect CSPs, supplies	
and equipment	
3. Handling and storage of all	
drugs and supplies	
4. How to check labels prior to	
administration	
5. Proper administration	
including aseptic technique	
6. Catheter care	
7. How to monitor for and detect	
complications	
8. What to do in the case of an	
emergency	
9. Proper waste disposal	
Hazardous Drug CSPs	
Hazardous drugs are prepared as CSPs	
only under conditions that protect the	
person who is compounding them.	
Hazardous drugs are stored separate	
from non-hazardous inventory,	
preferably in a negative pressure area.	
The storage area should have	
sufficient exhaust ventilation with at	
least 12 air changes per hour. Access	
to the storage area is limited.	
Hazardous drugs are handled using	
appropriate chemotherapy gloves	

P			
including during stocking, receiving,			
preparation and disposal.			
Hazardous drugs are prepared in an			
ISO 5 environment or better in a			
protective engineering control			
following aseptic practices. Access to			
the preparation area is limited.	j		
Hazardous drugs are prepared in a BSC			
or CACI. The BSC or CACI is an ISO 5			
environment placed in an ISO 7 area,			
physically separate from other			
preparation areas. The ISO 7 area			
optimally is a negative pressure area			
that has not more than 0.01 inch			
water column negative pressure to the			
adjacent room (a pressure gauge is			
installed to ensure adequate		i	
pressure).	1.		
The BCS or CACI is 100% vented to the			
outside via a HEPA filter to protect the			
environment.			
When CSTDs are used to prepare			
hazardous preparations they are used			
within an ISO 5 BSC or CACI located in			
j			
an ISO 7 negative pressure area as per			
above (In facilities that prepare a small			
volume of hazardous preparations the			
use of a CSTD within an ISO 5 BSC or		j	
CACI located in a negative pressure			
area is acceptable).			
Personnel who compound hazardous			
preparations utilize appropriate PPE.			
Personnel should double glove with		ļ	
sterile chemotherapy-appropriate			
gloves.	<u> </u>		
All personnel who compound			
hazardous preparations are properly			
trained in the storage, handling and			
disposal of hazardous substances.			
Training occurs prior to the	rimenanti	1	1
preparation of hazardous drugs and its		MARKET PARTY AND AND AND AND AND AND AND AND AND AND	
effectiveness is verified by testing of		Ì	į
technique annually. This verification is		ļ	
documented.	<b> </b> .		
	<del>                                     </del>	·	
Hazardous drug preparation training		Ì	
includes didactic summary of mutagenic, teratogenic and	1	1	
	i i	!	

carcinogenic properties. Training also			
includes aseptic technique, negative			
pressure technique, proper CSTD use,			
hazardous drug disposal and cleanup			
of hazardous material spills. Training			
also includes treatment of staff that			
have come in contact with hazardous			
materials.			
Disposal of hazardous drug waste			
complies with all federal and state			
regulations.			
Personnel of child bearing ability are			
required to provide written			
verification that they understand the			
risks of working with hazardous drugs.	:		
Radiopharmaceuticals			
Radiopharmaceuticals prepared from			
sterile components with a volume of			
100ml or less for single doses and			
30ml or less for multiple dose			
containers conform to the specific			
recommendations set forth for low-			
risk level CSP compounding. These			
preparations are compounded in an		}	
ISO 5 PEC located within an ISO 8			
environment			
Technetium-99m vials which were			
punctured in an ISO 5 environment		T-A	
with a sterile needle may be used up		-	<u> </u>
to the time allotted according to		•	
manufacturer recommendations			
Radiopharmaceuticals classified as low			
risk CSPs with 12 hour or less BUD are			
prepared in a separated compounding			
area defined by a line of demarcation.			
Allergen extracts			
Allergen extracts meet the			
requirements set forth in the CSP			1
Microbial Contamination Risk Levels			
section of USP 797 except where they	culture		
meet the following criteria:			
compounding involves only			
simple transfer of sterile,			
commercial allergen products

April 30, 2003 03-18

# RECALLS AND FIELD CORRECTIONS: FOODS - CLASS II

#### PRODUCT

Yellow Fin Tuna - Vacuum packaged. Recall #F-331-3.

CODE

The product was uncoded.

#### RECALLING FIRM/MANUFACTURER

Schneider's Fish & Seafood Corp, Cheektowaga, NY, by telephone, and letter on July 27, 2001. FDA initiated recall is complete.

#### REASON

Unlabeled product and lack of assurance of proper temperature controls during thawing,

VOLUME OF PRODUCT IN COMMERCE

110 lbs.

DISTRIBUTION

NY.

# PRODUCT

Paradise Brand; Cryo-Freeze Tuna Steaks. Recall # F-332-3.

#### CODE

- a) Burris Lot #89892;
- b) Burris Lot #87869;
- c) Americold Lot #25282.

# RECALLING FIRM/MANUFACTURER

Ocean Duke Corporation, Torrance, CA, by email on December 16, 2001, and by telephone and faxed letters on December 18, 2001. Firm initiated recall is complete.

#### REASON

Vacuum-packaged tuna loins were inadequately labeled resulting in the potential for the formation of C. botulinum toxin due to temperature abuse.

# VOLUME OF PRODUCT IN COMMERCE

- a) 2,500 cases of 6/8 oz;
- b) 3,300 cases of 6/8 oz:
- c) 795 cases of 8/10 oz.

#### DISTRIBUTION

NY, MD, OH, IL, and MA.

#### PRODUCT

Springfield Smoked Fish Co., Inc. Brand:

Vacum Packed:

4/20/2015

ENFORCEMENT REPORT FOR APRIL 30, 2003

# VOLUME OF PRODUCT IN COMMERCE

a) 4,362 vials;

b) 479 vials.

DISTRIBUTION

Nationwide

# RECALLS AND FIELD CORRECTIONS: DRUGS - CLASS III

#### **PRODUCT**

Necon 0.5/35 Tablets (norethindrone 0.5mg and ethinyl estradiol 35meg), 6 tablet dispensers, 28 tablets each, Rx only. Recall # D-185-3.

#### CODE

Lot 50701 D00, Exp April 2003.

## RECALLING FIRM/MANUFACTURER

Watson Diagnostics, Inc, by letter on January 9, 2003. Firm initiated recall is ongoing.

#### REASON

Impurities; product exceeds total impurities specification (stability).

# VOLUME OF PRODUCT IN COMMERCE

6,366 cartons.

#### DISTRIBUTION

Nationwide.

#### PRODUCT

a) Methylprednisolone AC (PF) Injection, 80mg/mL,

I ml vial, Rx only, Recall # D-215-3;

b) Methylprednisolone AC (PF) Injection, 40mg/mL,

1 mL vial, Rx only. Recall # D-217-3.

### CODE

a) Lot Codes: 04172002@7, 04112002@8, 03282002@10,

03122002@12, 02272002@8, 02132002@1, 02052002@6

Dear Mr. Cadden:

On September 23, 2004, investigators from the U.S. Food and Drug Administration (FDA) and the Massachusetts Board of Pharmacy inspected your firm, located at 697 Waverly Street, Framingham, Massachusetts. On January 19, 2005, the inspection was completed. This inspection revealed that your firm compounds human prescription drugs in various dosage forms and strengths.

We acknowledge the receipt of your October 1, 2004, letter addressed to FDA's New England District Office, concerning questions presented during the referenced inspection.

FDA's position is that the Federal Food, Drug, and Cosmetic Act (FDCA) establishes agency jurisdiction over "new drugs," including compounded drugs. FDA's view that compounded drugs are "new drugs" within the meaning of 21 U.S.C. § 321(p), because they are not "generally recognized, among experts . . . as safe and effective," is supported by substantial judicial authority. See Weinberger v. Hynson, Westcott & Dunning, 412 U.S. 609, 619, 629-30 (1973) (explaining the definition of "new drug"); Prof'ls & Patlents for Customized Care v. Shalala, 56 F.3d 592, 593 n.3 (5th Cir. 1995) (the FDCA does not expressly exempt pharmacies or compounded drugs from its new drug provisions); In the Matter of Establishment Inspection of: Wedgewood Village Pharmacy, 270 F. Supp. 2d 525, 543-44 (D.N.J. 2003), aff'd, Wedgewood Village Pharmacy v. United States, 421 F.3d 263, 269 (3d Cir. 2005) ("The FDCA contains provisions with explicit exemptions from the new drug . . . provisions. Neither pharmacies nor compounded drugs are expressly exempted."). FDA maintains that, because they are "new drugs" under the FDCA, compounded drugs may not be introduced into interstate commerce without FDA approval.

## 2008 > New England Compounding Center 04-Dec-06

efficacy. However, FDA has long recognized the important public health function served by traditional pharmacy compounding. FDA regards traditional compounding as the extemporaneous combining, mixing, or altering of ingredients by a pharmacist in response to a physician's prescription to create a medication tailored to the specialized needs of an individual patient. See Thompson v. Western States Medical Center, 535 U.S. 357, 360-61 (2002). Traditional compounding typically is used to prepare medications that are not available commercially, such as a drug for a patient who is allergic to an ingredient in a mass-produced product, or diluted dosages for children.

Through the exercise of enforcement discretion, FDA historically has not taken enforcement actions against pharmacies engaged in traditional pharmacy compounding. Rather, FDA has directed its enforcement resources against establishments whose activities raise the kinds of concerns normally associated with a drug manufacturer and whose compounding practices result in significant violations of the new drug, adulteration, or misbranding provisions of the FDCA.

FDA's current enforcement policy with respect to pharmacy compounding is articulated in Compliance Policy Guide (CPG), section 460.200 ["Pharmacy Compounding"], issued by FDA on May 29, 2002 (see Notice of Availability, 67 Fed. Reg. 39,409 (June 7, 2002)).1¹ The CPG identifies factors that the Agency considers in deciding whether to initiate enforcement action with respect to compounding. These factors help differentiate the traditional practice of pharmacy compounding from the manufacture of unapproved new drugs. They further address compounding practices that result in significant violations of the new drug, adulteration, or misbranding provisions of the FDCA. These factors include considering whether a firm compounds drugs that are copies or essentially copies of commercially available FDA-approved drug products without an FDA sanctioned investigational new drug application (IND). The factors in the CPG are not intended to be exhaustive and other factors may also be appropriate for consideration.

# 1. Copies of Commercially Available Druo Products;

It has come to our attention that you are compounding trypan blue ophthalmic products. During the inspection at your firm, you advised an investigator from FDA's New England District Office that the trypa blue products that your firm compounds are devices. FDA classifies trypan blue products as drugs, not devices. Further, on December 16, 2004, trypan blue ophthalmic solution was approved by FDA and it is commercially available. As stated in the CPG, FDA will not exercise its enforcement discretion for the compounding of copies of commercially available FDA-approved products, including this one.

We have also learned that your firm may be compounding 20% aminolevulinic acid solution (ALA), Please note that there is a commercially available, FDA-approved aminolevulinic acid solution 20%. Like compounded trypan blue, FDA regards compounded 20% aminolevulinic acid solution as a copy of commercially available drug.

Although Section 503A of the FDCA (21 U.S.C. § 353a) addresses pharmacy compounding, this provision was invalidated by the Supreme Court's ruling in Thompson v. Western States Medical Center, 535 U.S. 357 (2002), that Section 503A included unconstitutional restrictions on commercial speech. And those restrictions could not be severed from the rest of 503A. In Thompson v. Western States Medical Center, 535 U.S. 357 (20020), the Supreme Court affirmed the Ninth Circuit ruling that the provisions in question violated the First Amendment.

FDA does not sanction the compounding of copies of FDA-approved, commercially available drugs and the agency will not exercise its enforcement discretion regarding the trypan blue and ALA products compounded by your firm.

All products compounded by your firm containing trypan blue or ALA are drugs within the meaning of section 201(g) of the FDCA (21 U.S.C. § 321(g)). These products are misbranded under section 502(f)(1) of the FDCA (21 U.S.C. § 352(f)(1)) in that their labeling fails to bear adequate directions for their use. They are not exempt from this requirement under 21 CFR § 201 .115 because they are new drugs within the meaning of section 201(p) of the FDCA and they lack approved applications filed pursuant to section 505 of the FDCA (21 U.S.C. § 355).

#### 2. Anesthetic Drug Products

Equally serious, your firm's promotional materials reveal that it offers to compound "Extra Strength Triple Anesthetic Cream" which contains 20% benzocaine, 6% Ildocaine, and 4% tetracaine. Like a manufacturer you have developed a standardized anesthetic drug product that you sell under the name "Extra Strength Triple Anesthetic cream," Further, you generate sales by giving physicians "courtesy prescriptions" (i.e., free samples). These actions are not consistent with the traditional practice of pharmacy compounding, in

4/20/2015

# 2006 > New England Compounding Center 04-Dec-06

prescriptions from licensed practitioners to meet the unique medical needs of individual patients.

Moreover, the agency is concerned with the public health risks associated with the compounding of "Extra Strength Triple Anesthetic Cream." There have been at least two nonfatal reactions and two deaths attributed to the use of compounded topical local anesthetic creams containing high doses of local anesthetics. Local anesthetics, like "Extra Strength Triple Anesthetic Cream," may be toxic at high dosages, and this toxicity can be additive. Further, there is a narrow difference between the optimal therapeutic dose of these products and the doses at which they become toxic, i.e. they have low therapeutic index.

Adverse events consistent with high systemic exposures to these products include seizures and cardiac arrhythmias. Specifically, risk of systemic adverse events from tetracaine products includes (1) a systemic allergic response to p-aminobenzoic acid (PABA) which, at worst, could lead to cardiac arrest; or (2) excessive systemic absorption following repetitive or extensive application, especially for a 4%a product, which could ultimately lead to convulsions. Tetracaine is associated with a higher incidence of allergic reactions than other anesthetics, such as Iidocaine. The risk of systemic toxicity is greatest in small children and in patients with preexisting heart disease. Factors that may increase systemic exposurare time and surface area of the exposure, particularly when the area of application is covered by an occlusive dressing. Benzocaine has an additional toxicity not seen with (idocaine, methemoglobinemia, an acquired decrease in the oxygen-carrying capacity of the red blood cells. Further, patients with severe hepatic disease are at greater risk of developing toxic plasma concentrations of local anesthetics because of their inability to metabolize them.

The Extra Strength Triple Anesthetic Cream compounded by your firm is a drug within the meaning of section 201(g) of the FDCA (21 U.S.C. § 321(g)). This product is misbranded under section 502(f)(1) of the FDCA (21 U.S.C. § 352(f)(1)) in that its labeling fails to bear adequate directions for its use. It is not exempt from this requirement under 21 CFR § 201.115, because it is a new drug within the meaning of section 201(p) of the FDCA that lacks an approved application filed pursuant to section 505 of the FDCA (21 U.S.C. § 355).

Depending on its labeling, this product may also violate section 502(a) of the FDCA (21 U.S.C. § 352(a)). A drug or device is misbranded under section 502(a) If its labeling is false and misleading in any particula (e.g., if the labeling for your local anesthetic products falls to reveal the consequences that may result from the use of the product as a local anesthetic).

#### 3. Repackaging:

Additionally, we are in receipt of a complaint alleging that you are repackaging the approved injectable drug, Avastin, into syringes for subsequent promotion and sale to health professionals. Avastin is unpreserved and is packaged and labeled in 4 and 16 ml single-use glass vials. The labeled precautions include "discard any unused portion left in a vial..." Each step in the manufacture and processing of a new drug or antibiotic, from handling of raw ingredients to final packaging, must be approved by FDA, whether carried out by the original manufacturer or by some subsequent handler or repacker of the product. Pharmacists are not exempt from these statutory requirements. Generally, the agency regards mixing, packaging, and other manipulations of approved drugs by licensed pharmacists, consistent with the approved labeling of the product, as an approved use of the product if conducted within the practice of pharmacy, i.e., filling prescriptions for identified patients. However, processing and repacking (including repackaging) of approved drugs is beyond the practice of pharmacy and is thus subject to the Act's premarket approval requirements.

The agency has an established policy, articulated in Compliance Policy Guide Sec. 446.100, Regulatory Action Regarding Approved New Drugs and Antibiotic Drug Products Subjected to Additional Processing or other Manipulations (CPG 7132c.06) (copy enclosed), concerning the manipulation of approved sterile drug products outside the scope of the FDA-approval. FDA is particularly concerned about the manipulation of sterile products when a sterile container is opened or otherwise entered to conduct manipulations. The moment a sterile container is opened and manipulated, a quality standard (sterility) is destroyed and previous studies supporting the standard are compromised and are no longer valid. We are especially concerned with the potential microbial contamination associated with splitting Avastin - a single-use, preservative-free, vial -- into multiple doses. When used intravitreally, microbes could cause endophthalmitis, which has a high probability for significant vision loss. The absence of control over storage, and delays before use after repackaging, only exacerbate these concerns.

Avastin is approved for use in the treatment of colorectal cancers. The text of your alleged promotional

2006 > New England Compounding Center 04-Dec-06

4/20/2015

such; your firm is distributing an unapproved new drug in violation of section 505 of the FDCA. Because the product lacks adequate labeling for its intended use (see 21 CFR § 201.128) your firm is also distributing a misbranded drug in violation of section 502(f)(1) of the FDCA (21 U.S.C. § 352(f)(1)). Also, please note that, under section 301(a) of the FDCA (21 U.S.C. § 331(a)), the introduction or delivery for introduction into interstate commerce of any drug that is misbranded is prohibited.

Under section 301(d) of the FDCA (21 U.S.C. § 331(d)), the introduction or delivery for introduction into interstate commerce of a new drug that has not been approved under section 505 is also prohibited.

Further, we have been informed that, although your firm advises physicians that a prescription for an individually identified patient is necessary to receive compounded drugs, your firm has reportedly also told physicians' offices that using a staff member's name on the prescription would suffice. Drugs compounded in this manner are not compounded consistent with the CPG, and FDA will not exercise its enforcement discretion regarding those drugs.

The above violations are not intended to be an all-inclusive list of deficiencies. You should take prompt action to correct these deviations. Failure to promptly correct these deviations may result in additional regulatory action without further notice, including selzure or injunction against you and your firm. Federal agencies are routinely advised of the issuance of warning letters so that they may take this information into account when considering the award of government contracts.

Please notify this office in writing within 15 working days of receipt of this letter of any steps that you wil take to correct the noted violations, including an explanation of the steps taken to prevent the recurrence of similar violations. If corrective action cannot be completed within 15 working days, please state the reason for the delay and the time within which the correction will be complete.

You should address your reply to this letter to the U.S. Food and Drug Administration, New England District Office, One Montvale Ave., 411 Floor, Stoneham, MA 02180, Attn: Ann Simoneau, Compliance Officer. If you have any further questions, please feel free to contact Ms. Simoneau at (781) 596-7732. Sincerely,

/s/

Gail Costello Disrict Director New England District Office

# ASHP Guidelines on Outsourcing Sterile Compounding Services

#### Purpose

Health care organizations considering outsourcing sterile compounding services should have a clear understanding of what they want to accomplish. Consideration should include, at the least, an internal needs assessment, a cost analysis, and a careful review of prospective compounding pharmacies. The organization should examine the potential long-term consequences of outsourcing as well as the short-term outcomes expected during a contract's performance period.

The purpose of these guidelines is to provide an overview of factors and processes for health care organizations to consider when exploring outsourcing of pharmacy sterile compounding. The ideas presented in this document could be used for strategic planning with the organization's decision-makers, for drafting contract provisions, for comparing prospective compounding pharmacies, for preparing for contract negotiations, or for evaluating a compounding pharmacy's performance.

This document includes ideas about reasons for outsourcing and reasons for not outsourcing, services available
from compounding pharmacies, the outsourcing process and
outsourcing arrangements, and evaluation of a compounding
pharmacy's performance. The appendix provides a topical list
of contract provisions, some of which relate to practices that
are the subject of other American Society of Health-System
Pharmacy (ASHP) guidelines. Organizations should refer
to pertinent ASHP guidelines for additional information on
which to base their contract provisions, agreements, and decisions. This document addresses representative outsourcing
options and contract agreements and is not intended to cover
all situations. Managers of pharmacy and health care organizations should use their professional judgment about applicability to their own needs and circumstances.

#### Environment

There are various environmental influences and market forces that may contribute to a facility's decision to consider outsourcing. A list of some of those considerations follows.

#### Organizational and Operational

- Limited available technological resources to provide the specific desired services.
- · Re-engineering and downsizing initiatives.
- Consolidation and integration of health systems and departments within health systems.
- Elimination of or reduction in the size of traditional pharmacy departments.
- Reorganization around patient-focused care.
- Implementation of automated pharmacy systems and the attendant need to reorganize medication preparation and distribution functions.

#### Staffing

Shortage of pharmacists, murses, and other health care professionals.

Shortage of pharmacy personnel with specific experience and capabilities.

#### Financial and Cost Control

- Restricted budgets.
- Increased operating costs.
- Increased drug costs.
- Increased emphasis on measuring performance in terms of staffing and costs.

#### Quality Assurance

 Increased expectations of and pressures from payers, accreditation organizations, and consumer groups to improve the quality of patient care, reduce the incidence of hospital infections, and demonstrate compliance with applicable standards and regulations.

#### Governmental and Regulatory

- Reductions of federal, state, and local government reimbursement for health care.
- Increased numbers of individuals dependent on federal, state, and local governments for health care.
- Increased federal and state interest in standards for sterile compounding (i.e., United States Pharmacopeia [USP] chapter 797⁴).

#### Competitive

- Increased competition among healthcare organizations
- Increased competition among suppliers of pharmaccutical products and related services.

#### Purposes of Outsourcing

Health care organizations that conduct in-depth assessments may decide that outsourcing either is or is not a good option for meeting their needs. Reasons for their decision will vary according to a variety of factors.

Reasons Health Care Organizations Outsource Sterile Compounding Services. Organizations tend to outsource sterile compounding services when guided by a careful assessment of their capabilities of providing services themselves, when unsuccessful in using their own resources to provide those services, or, in some cases, upon advice from a consultant. Contracting with an outsourcing firm may produce one or more of the following results.

#### Organizational and Operational

 Ease the consolidation of pharmaceutical services in integrated health systems.

- Resolve operational inefficiencies (e.g., batch compounding, staff scheduling, high-demand periods).
- Provide compounded preparations outside the scope of preparations routinely provided (e.g., complex or rarely compounded preparations).
- Enable the organization to acquire additional resources and expertise to carry out other priorities (e.g., reallocation of existing staff to roles in patient care areas).

#### Staffing

- Help the organization to staff hard-to-fall pharmacy positions and address staffing vacancies.
- Allow the organization to reach optimal staffing levels for achieving productivity targets.

#### Financial and Cost Control

- Control or reduce the cost of the organization's services (e.g., by shifting costs associated with i.v. admixture production from fixed to variable).
- Control or reduce labor costs (e.g., by shifting responsibility for employees, benefits, and liabilities to a compounding pharmacy).
- Enable the organization to acquire a business partner to share the risks and other associated liability by defining the responsibilities associated with operating sterile compounding services.
- Minimize the cost of facility remodeling (e.g., to meet USP 797 requirements).

#### Quality Assurance

- Provide consistent pharmacy and starile compounding services, including documented beyond-use dating.
- Enable the organization to maintain or improve the quality of patient care (e.g., by expanding clinical services or establishing new services).
- Provide support for the medical and nursing staffs and improve physician-nursing-pharmacy collaboration.
- Improve organizational procedures by learning from the compounding pharmacy's experience and knowledge, especially with new technologies (e.g., labeling, bar-coding, or tamper-evidence technologies).

#### Governmental and Regulatory

 Assist and ensure compliance with legal, regulatory, certification, and accreditation requirements.

#### Competitive

 Allow the organization to gain an edge on competitors through improvements in service, quality, or price.

Reasons Health Care Organizations Do Not Outsource Sterile Compounding Services. An organization's choice to continue providing its own sterile compounding services may be based on one or more of the following reasons.

#### Organizational and Operational

- The organization demonstrates that its sterile compounding services are cost-effective, well managed, and provided as efficiently as or better than they could be by a compounding pharmacy.
- Negative experiences with outsourcing pharmacy (or even nonpharmacy) services, or awareness of other organizations' negative experiences with such outsourcing.
- Concern about time delays in receiving compounded preparations, especially products that are needed urgently or have poor stability or short beyond-use times
- Concern that the compounding pharmacy may experience interruptions in service, perhaps with little notice, due to quality-control issues not related to services provided to the organization.
- Concern that the decision to outsource sterile compounding services can be reversed only with great difficulty.
- Concern about losing short-term and long-term control over decisions regarding or expertise in sterile compounding services.

#### Staffing

 Concern that staff will be reduced to unacceptable levels.

#### Financial and Cost Control

- An assessment that outsourcing would increase rather than decrease costs.
- Concern that high-cost drugs might be excluded from contract agreements.
- Concern that the organization may not be able to recapitalize sterile compounding services if outsourcing is unsuccessful.

#### Quality Assurance

- Concern that conflicting values and priorities of the compounding pharmacy and the organization will reduce quality.
- Concern about the qualifications or competencies of compounding pharmacy staff,

#### Professional Responsibility

Concern that outsourcing sterile compounding will confuse or dilute the onsite pharmacists' ultimate professional and legal authority and responsibility for other medication-related activities and outcomes at the site.

# Services Provided by Compounding Pharmacles

The needs of the health care organization should guide the identification of potential compounding pharmacies with the appropriate expertise and capabilities. Among the services that may be available from compounding pharmacies are

#### 374 Pharmacy Management-Guidelines

the preparation of implantable and external pump cartridges; total parenteral nutrition, dialysis, irrigation, or cardioplegia solutions; antibiotics; ophthalmic injectables and solutions; chemotherapy preparations; and analgesic preparations (patient-controlled analgesia, epidural, or regional nerve-block devices).

Compounding pharmacies are regulated in a number of ways. They may be registered as pharmacies and/or wholesalers in the states in which they dispense, as drug establishments and/or device manufacturers by the Food and Drug Administration (FDA), and/or as manufacturers by the Drug Enforcement Administration (DEA). FDA requires a device manufacturer registration for a compounding pharmacy to dispense devices such as dialysate solutions or heparin or citrate syringes. A compounding pharmacy registered as a drug establishment may apply for a labeler code that allows it to create National Drug Code (NDC) numbers for its products. These NDC numbers do not indicate FDA approval or that a New Drug Application has been filed, nor do they indicate a higher degree of quality (e.g., that terminal sterilization rather than an aseptic fill process has been used in compounding the preparation). Ascertaining that a preparation is labeled with an NDC number is therefore not a substitute for the due diligence required to verify a compounding pharmacy's quality processes (e.g., USP 797, current good manufacturing processes). Finally, compounding pharmacies are not permitted to prepare copics of commercial products. Dispensing of such products by compounding pharmacies will result in regulatory action, as FDA enforcement discretion does not apply to copies of commercial products.

#### **Outsourcing Process**

After the health care organization has completed an internal assessment of its needs and capabilities and decided to explore outsourcing, it should identify and contact reputable compounding pharmacies. Organizations that are part of a larger network (e.g., an integrated delivery network) may explore options that are available to them through the network or from other organizations in the network.

Some organizations simply identify prospective compounding pharmacies and ask them to submit a proposal. A more thorough approach is to require prospective compounding pharmacies to respond to a request for proposal (RFP). Although a formal RFP (and the compounding pharmacy's formal proposal based on the RFP) may not be necessary, the information found in typical RFPs and proposals may be helpful for making a decision about outsourcing.

Contents of RFPs. RFPs often include the following information:

- A description of the demographics of the organization making the RFP (e.g., number of hospitals, bed sizes, typical census).
- A description of the process the organization will use to select the compounding pharmacy.
- The organization's standard terms and conditions for contracting for services or, if available, a sample contract from the organization.
- The names and telephone numbers of individuals in the organization who are involved in the outsource-

- ing decision (the organization's director of pharmacy should be included).
- A description of the specific services required of the compounding pharmacy (e.g., volume, intravenous admixture preparation, automated pharmacy systems, existing intravenous delivery systems and devices) and performance-measurement criteria or targets.
- The dates on which the organization's representatives can inspect the compounding pharmacy's facility, with reasonable notice.
- The number of copies of the proposal to submit.
- The name and address of the individual to whom the proposal is to be delivered.
- Acceptable methods for delivery of the proposal (e.g., e-mail, mail, delivery service, courier).
- A statement that the organization reserves the right to cancel its solicitation for services and reject any and all proposals.
- A deadline date and time for receipt of the proposal.
- The date on which the compounding pharmacy would be expected to initiate services.
- The date by which the selected compounding pharmacy must provide a written contract.
- Other requirements related to the proposal (e.g., that it be in a specific file format, include reference to an RFP number [if any], or be signed by an officer of the finn who is authorized to contract or his or her designee).

Contents of Proposals. RFPs should require prospective compounding pharmacies to submit the following information with their proposals:

- A brief history of the compounding pharmacy, including its mission, vision, and values.
- The location of the compounding pharmacy's offices and other facilities that would provide services to the organization.
- The compounding pharmacy's regular business hours or hours of operation and emergency and after-hours contact information.
- The names, addresses, telephone numbers, and resumés or background information on individuals who will provide the outsourced services.
- Assurance that all pharmacists employed at the compounding facility are licensed as required.
- Evidence of the following documentation regarding the compounding pharmacy:
  - · Proof of current liability insurance.
  - Current accreditation or certification certificates, if applicable.
  - State pharmacy licensure and other appropriate
    licenses
  - Licensure documents if the compounding pharmacy is registered with FDA as a drug establishment or device manufacturer.
  - Current DEA registration as a manufacturer or wholesalez.
  - Licensure of pharmacists employed and verification that they are in good standing on file and available for review.
  - Registration of pharmacy technicians employed and verification that they are in good standing on file and available for review, if applicable.

- Pharmacist and pharmacy technician notarized statements stating they have never been convicted of a drug-related misdemeanor or felony on file and available for review.
- Standard operating procedures manual on file and available for review.
- Pharmacist training manual on file and available for review.
- Pharmacy technician training manual on file and available for review.
- Policies and procedures for sterility testing on file and available for review.
- Policies and procedures for pyrogen testing on file and available for review, if applicable.
- Examples of batch reports for products being considered for outsourcing.
- * Examples of the quality-control reports.
- Stability documents and clinical references, as well as any materials that are used to determine beyond-use dates.
- A history of the results of all accreditation or regulatory surveys conducted of the compounding pharmacy's sites, including copies of significant regulatory actions.
- Proof of professional liability, general liability, and workers' compensation insurance coverage (including the name, address, and telephone number of the insurance company).
- Experience (e.g., years of experience in providing sterile compounding services, total number of clients served, current number of clients).
- A list of the requested services that the compounding pharmacy can provide and the normal terms of service, including but not limited to normal delivery cycles, availability and cost of emergency preparation and delivery, remedies for failure to perform to the contract, specific goods and services to be provided, and the infrastructure available at the compounding pharmacy for electronic ordering.
- A list of the requested sterile compounding services that the compounding pharmacy cannot provide and the reasons for its inability to provide them.
- A copy of a standard or proposed contract.
- A list of all fees and charges, including shipping, handling, and delivery charges, and any fees associated with order changes that would be billed under the contract and the billing methodology for their calculation.
- A billing schedule and a copy of a sample bill for each
  of the preparations compounded by the compounding
  pharmacy.
- A description of a routine delivery schedule (e.g., daily by a specified time) and options for nonroutine delivery (e.g., later the same day, after hours, weekends, holidays, during emergencies).
- Examples of reports that the compounding pharmacy will be expected to submit to the organization.
- Information relating to the compounding pharmacy's financial status and stability (e.g., balance sheets and audited financial statements for the past three years, bank references, lists of principal equity owners).
- The process for requesting new preparations from the compounding pharmacy.

- The names, addresses, and telephone numbers of
  - Current clients of a similar size or receiving similar types of compounded preparations, with written references and copies of annual performance improvement reports, if possible.
  - Reference accounts served within the past two years and the reasons for all, if any, terminations of services.

Additional information to obtain from the prospective compounding pharmacy but not necessarily contained in the proposal may include

- Whether the compounding pharmacy has had product liability lawsuits filed against it for preparations it compounded. If so, the compounding pharmacy should be asked to provide a description of the lawsuits filed, the file date of the lawsuits, and the outcome.
- A description of the compounding pharmacy's formal procedures for conducting recalls and whether there have ever been recalls of any of its compounded preparations. If the compounding pharmacy has ever recalled any of its compounded preparations, it should be asked to provide the dates of recall, a description of the preparations recalled, and the reasons for the recall.
- Information related to the delivery process (especially in the case of severe weather).

Visits to Compounding Pharmacies and Their Clients. Compounding pharmacies should allow the organization's representatives to visit their corporate offices and compounding facilities. The compounding pharmacy should provide ample opportunity for the organization's representatives to confer with the compounding pharmacy's corporate, pharmacy, and compounding staff.

Evaluating Proposals. A decision to outsource sterile compounding services should be collaborative and may involve, as appropriate, the governing board, the chief executive officer (CEO), the chief financial officer (CFO), the chief operating officer (COO), the chief of the medical staff, the chair of the pharmacy and therapeutics (P&T) committee, the director of nursing (DON), the director of pharmacy, logal counsel, and department heads, for example. The organization should scrutinize the following factors when evaluating proposals:

- Services offered versus services requested (including the compounding pharmacy's potential to enhance currently offered sterile compounding services).
- Professional experience (e.g., years of service; number, size, and types of clients; knowledge of the organization's operations).
- Quality management program, specifically as it relates to facility cleaning and validation, staff training, and competency assessment.
- Financial stability (e.g., ability to absorb start-up expenses and to commit the resources needed to initiate service),
- References and reputation.
- Information systems and other technological infrastructure (e.g., the capability to interface with the organization's information and drug delivery systems, such

#### 376 Pharmacy Management-Guidelines

- as infusion pumps or bar-coded medication administration systems).
- Demonstrated commitment to continually integrating technology and knowledge to improve patient safety.
- Education and training of compounding pharmacy's staff (e.g., internal and external continuing-education programs, educational allowances for professional and technical staff).
- The organization's and the compounding pharmacy's policies on specific compounding practices (e.g., references with real-time stability data supporting beyonduse dating, compliance with standards and regulations, use of USP-NF-grade ingredients or FDA-approved products in accordance with the organization's intended use).
- Risk assessment program to ensure that medication errors are not introduced by new or increased outsourced compounding activities and that the medications dispensed are compatible with the client's medication administration devices (e.g., bar-code labeling, smart pumps).
- Knowledge of the regulatory requirements and accreditation standards that the customer must meet and willingness to assist customers in meeting these standards.
- Inventory and supply chain issues (e.g., the organization's and compounding pharmacy's back-order policies).
- Emergency-preparedness implications (e.g., the ability of the organization and the compounding pharmacy to deliver services in the event of a disaster).
- Additional qualities (e.g., high employee morale, confidentiality, creativity, dedication to the community, collaborative spirit).
- Cost aspects of services (e.g., cost-effectiveness, ability to achieve economics of scale).

The compounding pharmacy should, at a minimum, be able to

- Provide assurance that each compounded sterile preparation meets applicable state and federal labeling requirements and is sterile and free of pyrogens and unintended particulate matter, according to professionally established and accepted quality monitoring data.
- If the compounding pharmacy is compounding highrisk preparations, provide documentation of the endproduct testing processes used to determine that compounded sterile preparations are sterile and free of pyrogens and unintended particulate matter.
- Deliver appropriate compounded preparations in tamper-resistant packaging and in containers that will maintain proper storage temperature and (when required) protection from light during delivery and storage.
- Provide, upon request, batch records for any compounded sterile preparation.

The organization should assign an evaluation rating to each proposal. Ratings should be weighted appropriately with respect to services, experience, references, and cost. The organization should base its decision to outsource sterile compounding services on its assessment of the compounding facility's ability to meet the organization's needs and fulfill the terms of the contract.

Outsourcing Arrangement. The health care organization and the compounding facility should agree on the outsourcing arrangement that best meets their needs. The contract should clearly describe all aspects of the outsourcing arrangement. The health care organization's pharmacy should

- Ensure that the proper body of the health care organization (e.g., the organization's P&T committee) has developed a formal process to identify which preparations will (and which preparations will not) be prepared by the compounding pharmacy, based on the therapeutic needs of patients and logistical considerations associated with using a compounding pharmacy.
- Establish the components of the medication order or prescription.
- Determine whether patient consent must be obtained for use of preparations compounded outside the health care organization's pharmacy, consistent with state board of pharmacy regulations and prevailing law.
- Ensure that the agreement and the compounding pharmacy facility have been reviewed by all the necessary bodies in the pharmacy's health care organization (a.g., the organization's risk management team, legal counsel, P&T and infection control committees, epidemiology department staff).
- Determine how to handle situations in which a patient presents with a compounded medication that neither the health care organization's pharmacy nor the compounding pharmacy prepares under the existing agreement (e.g., medication in an implantable device, i.v. push medication, i.v. infusion) and that has not been previously considered by the P&T committee. Considerations include what the process will be for
  - Having the P&T committee consider outsourcing the compounding of such medications to a compounding pharmacy.
  - Acquiring such medications from a compounding pharmacy that the health care organization does not have an agreement with and how the associated liability risks will be addressed until the P&T committee decision is obtained regarding such medications.
  - Continuing to acquire such medications if the
    compounding pharmacy already under contract
    cannot or will not prepare them and how the associated liability risks will be addressed (e.g.,
    whether the health care organization's pharmacy
    will negotiate an agreement with another compounding pharmacy that does compound the
    preparation) until the P&T committee decision
    is obtained regarding such medications.

Negotiating the Contract. The health care organization should carefully review the proposal and clarify the provisions of the contract. Active participation by the health care organization's risk management and legal counsel is highly recommended. Negotiations can ensure a contract that best meets the needs of the health care organization and the compounding pharmacy. ASIP believes that the health care organization's pharmacist-in-charge (e.g., a pharmacy director) must take complete responsibility for patient outcomes from all medication-related activities performed at or for the
